Powerful Jet from a Supermassive Black Hole in Galaxy System 3C 321  HUBBLESITE.org

Galaxy-SMBH connection: the numerical gap

Powerful Jet from a Supermassive Black Hole in Galaxy System 3C 321  HUBBLESITE.org

Galaxy-SMBH connection: the numerical gap

- Accretion/jet production region: $R_d \sim 10^3 r_g$ ($\sim 4.78 \times 10^{-3}$ pc)

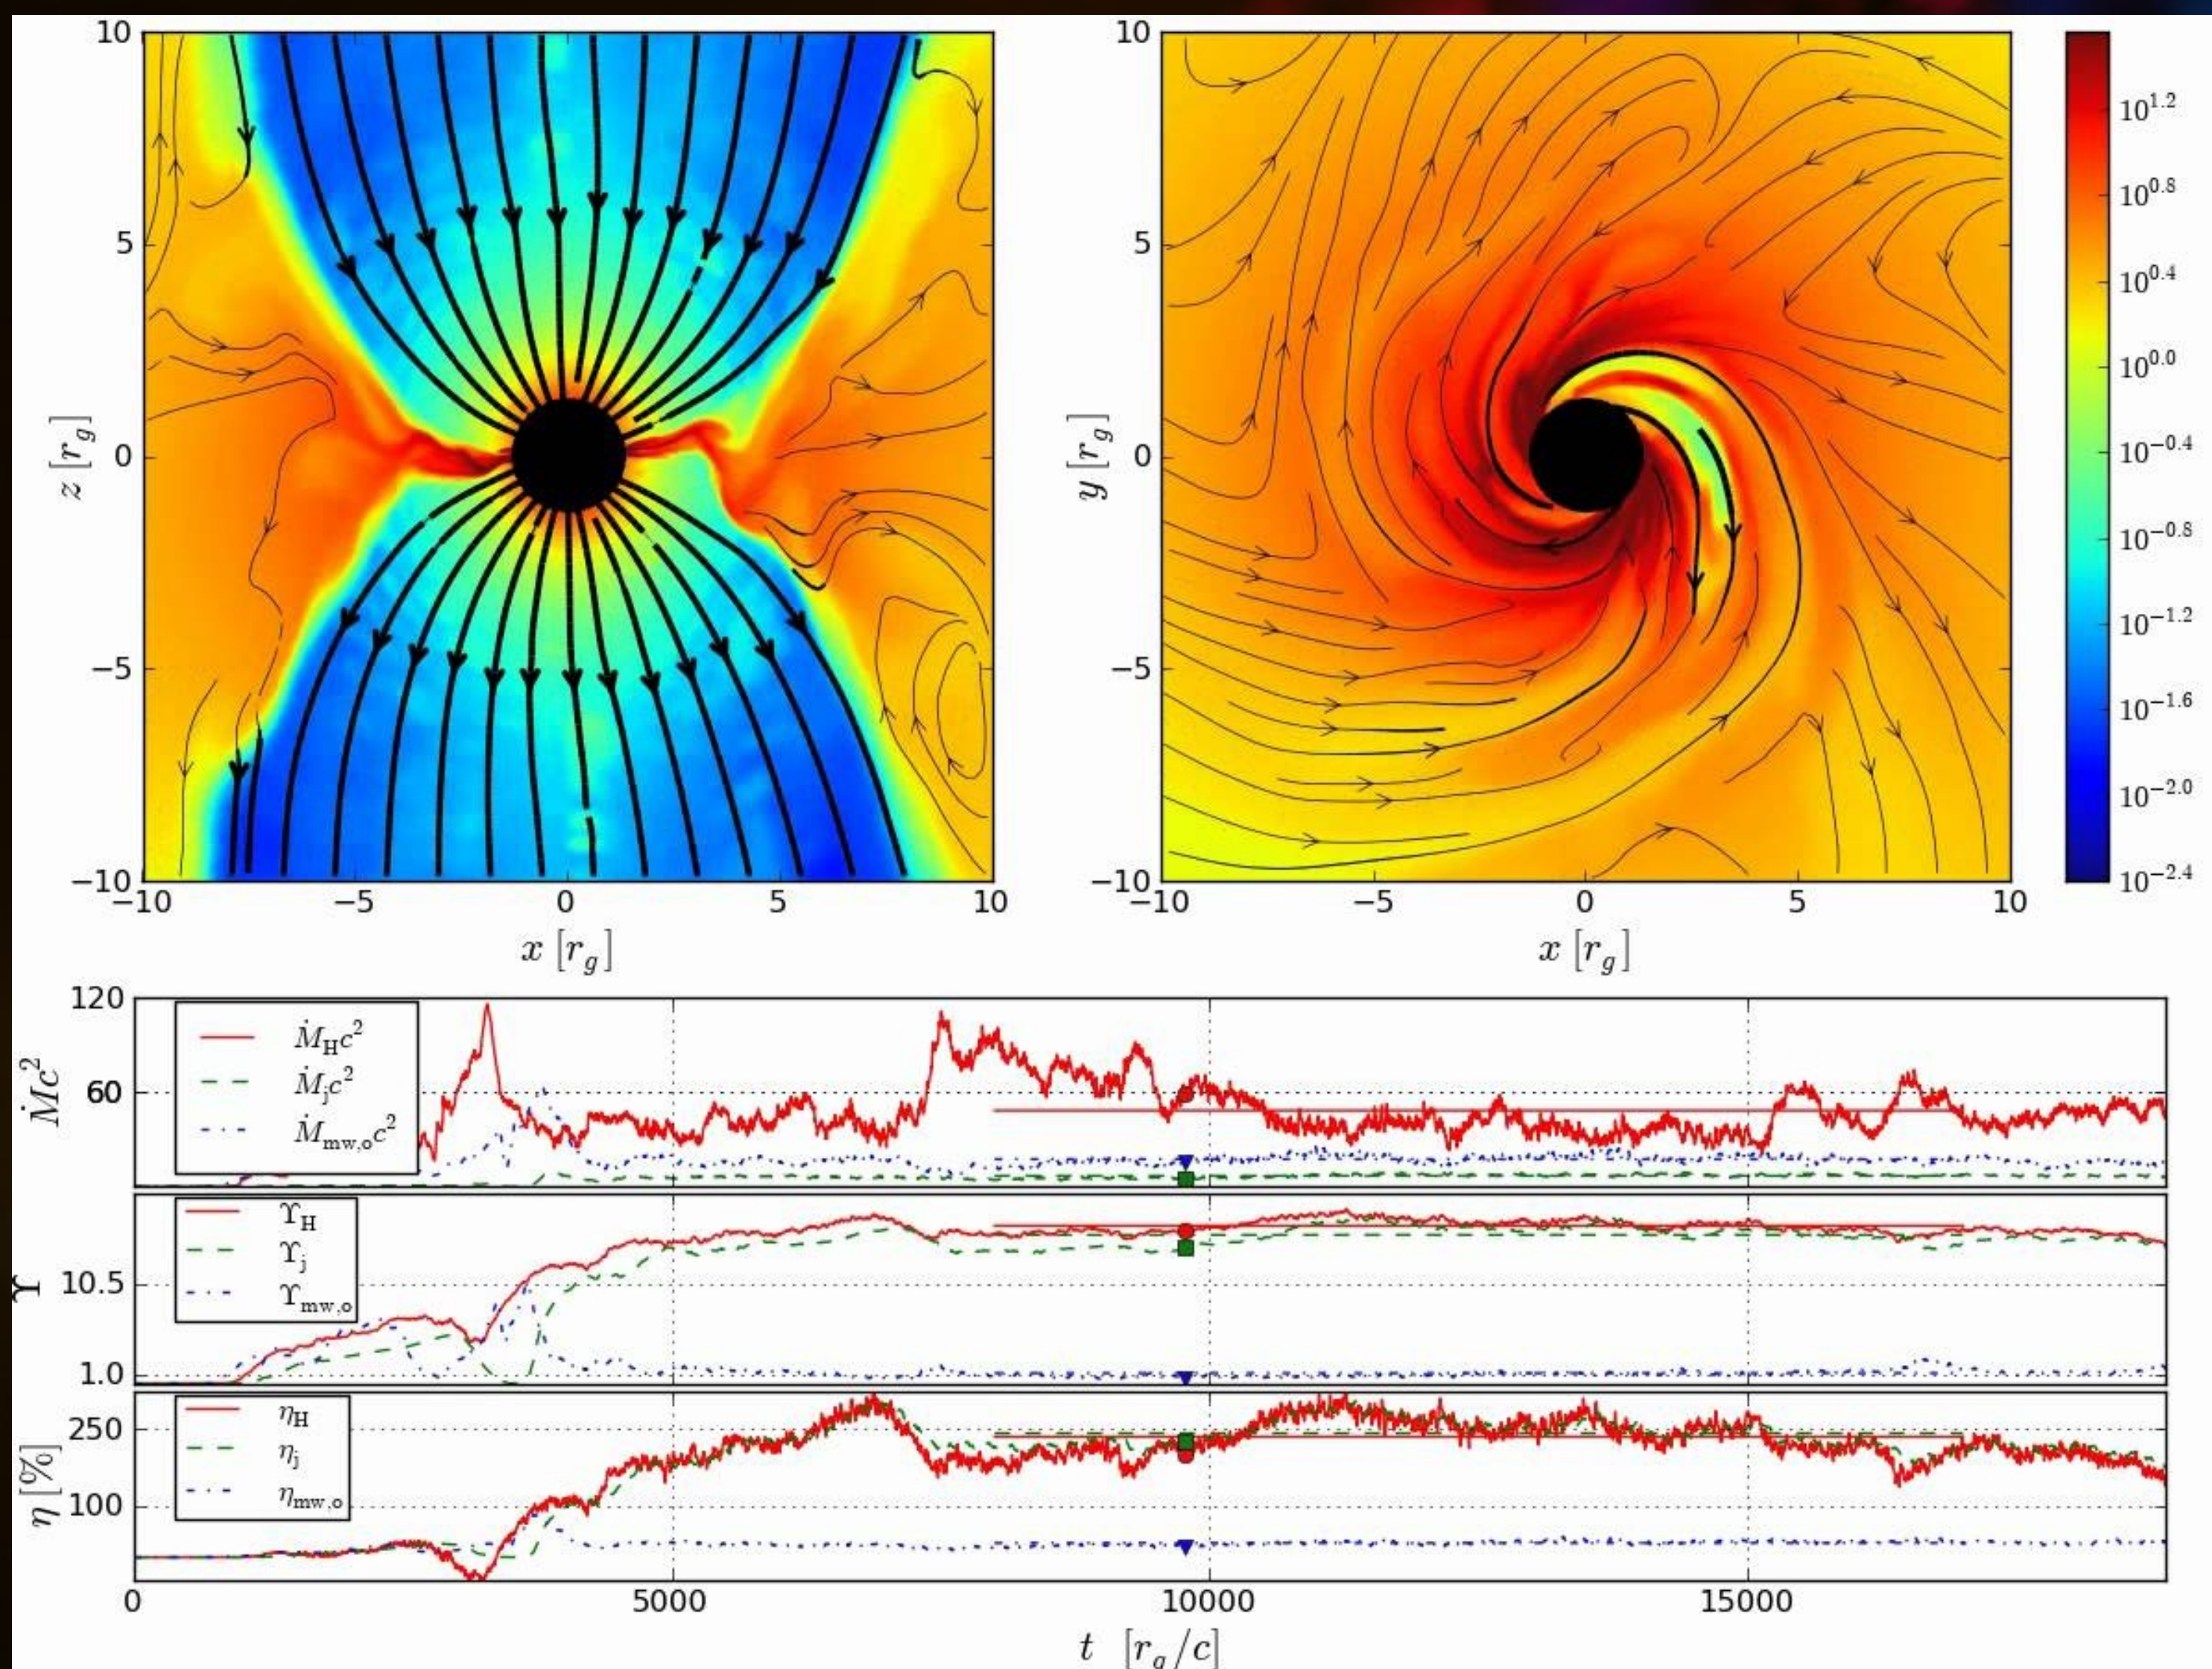

Galaxy System 3C 321  HUBBLESITE.org

Galaxy-SMBH connection: the numerical gap

- Accretion/jet production region: $R_d \sim 10^3 r_g$ ($\sim 4.78 * 10^{-3}$ pc)

AMR (Gaspari, Brügger, Fong, Bicknell, Wagner, Cielo+V.A.-D.,...):

$l_{\max}=10-15 \rightarrow R = L_{\text{box}}/2^{l_{\max}} \simeq 1.52 - 48.8$ pc, 3 orders of magnitude larger than R_d production

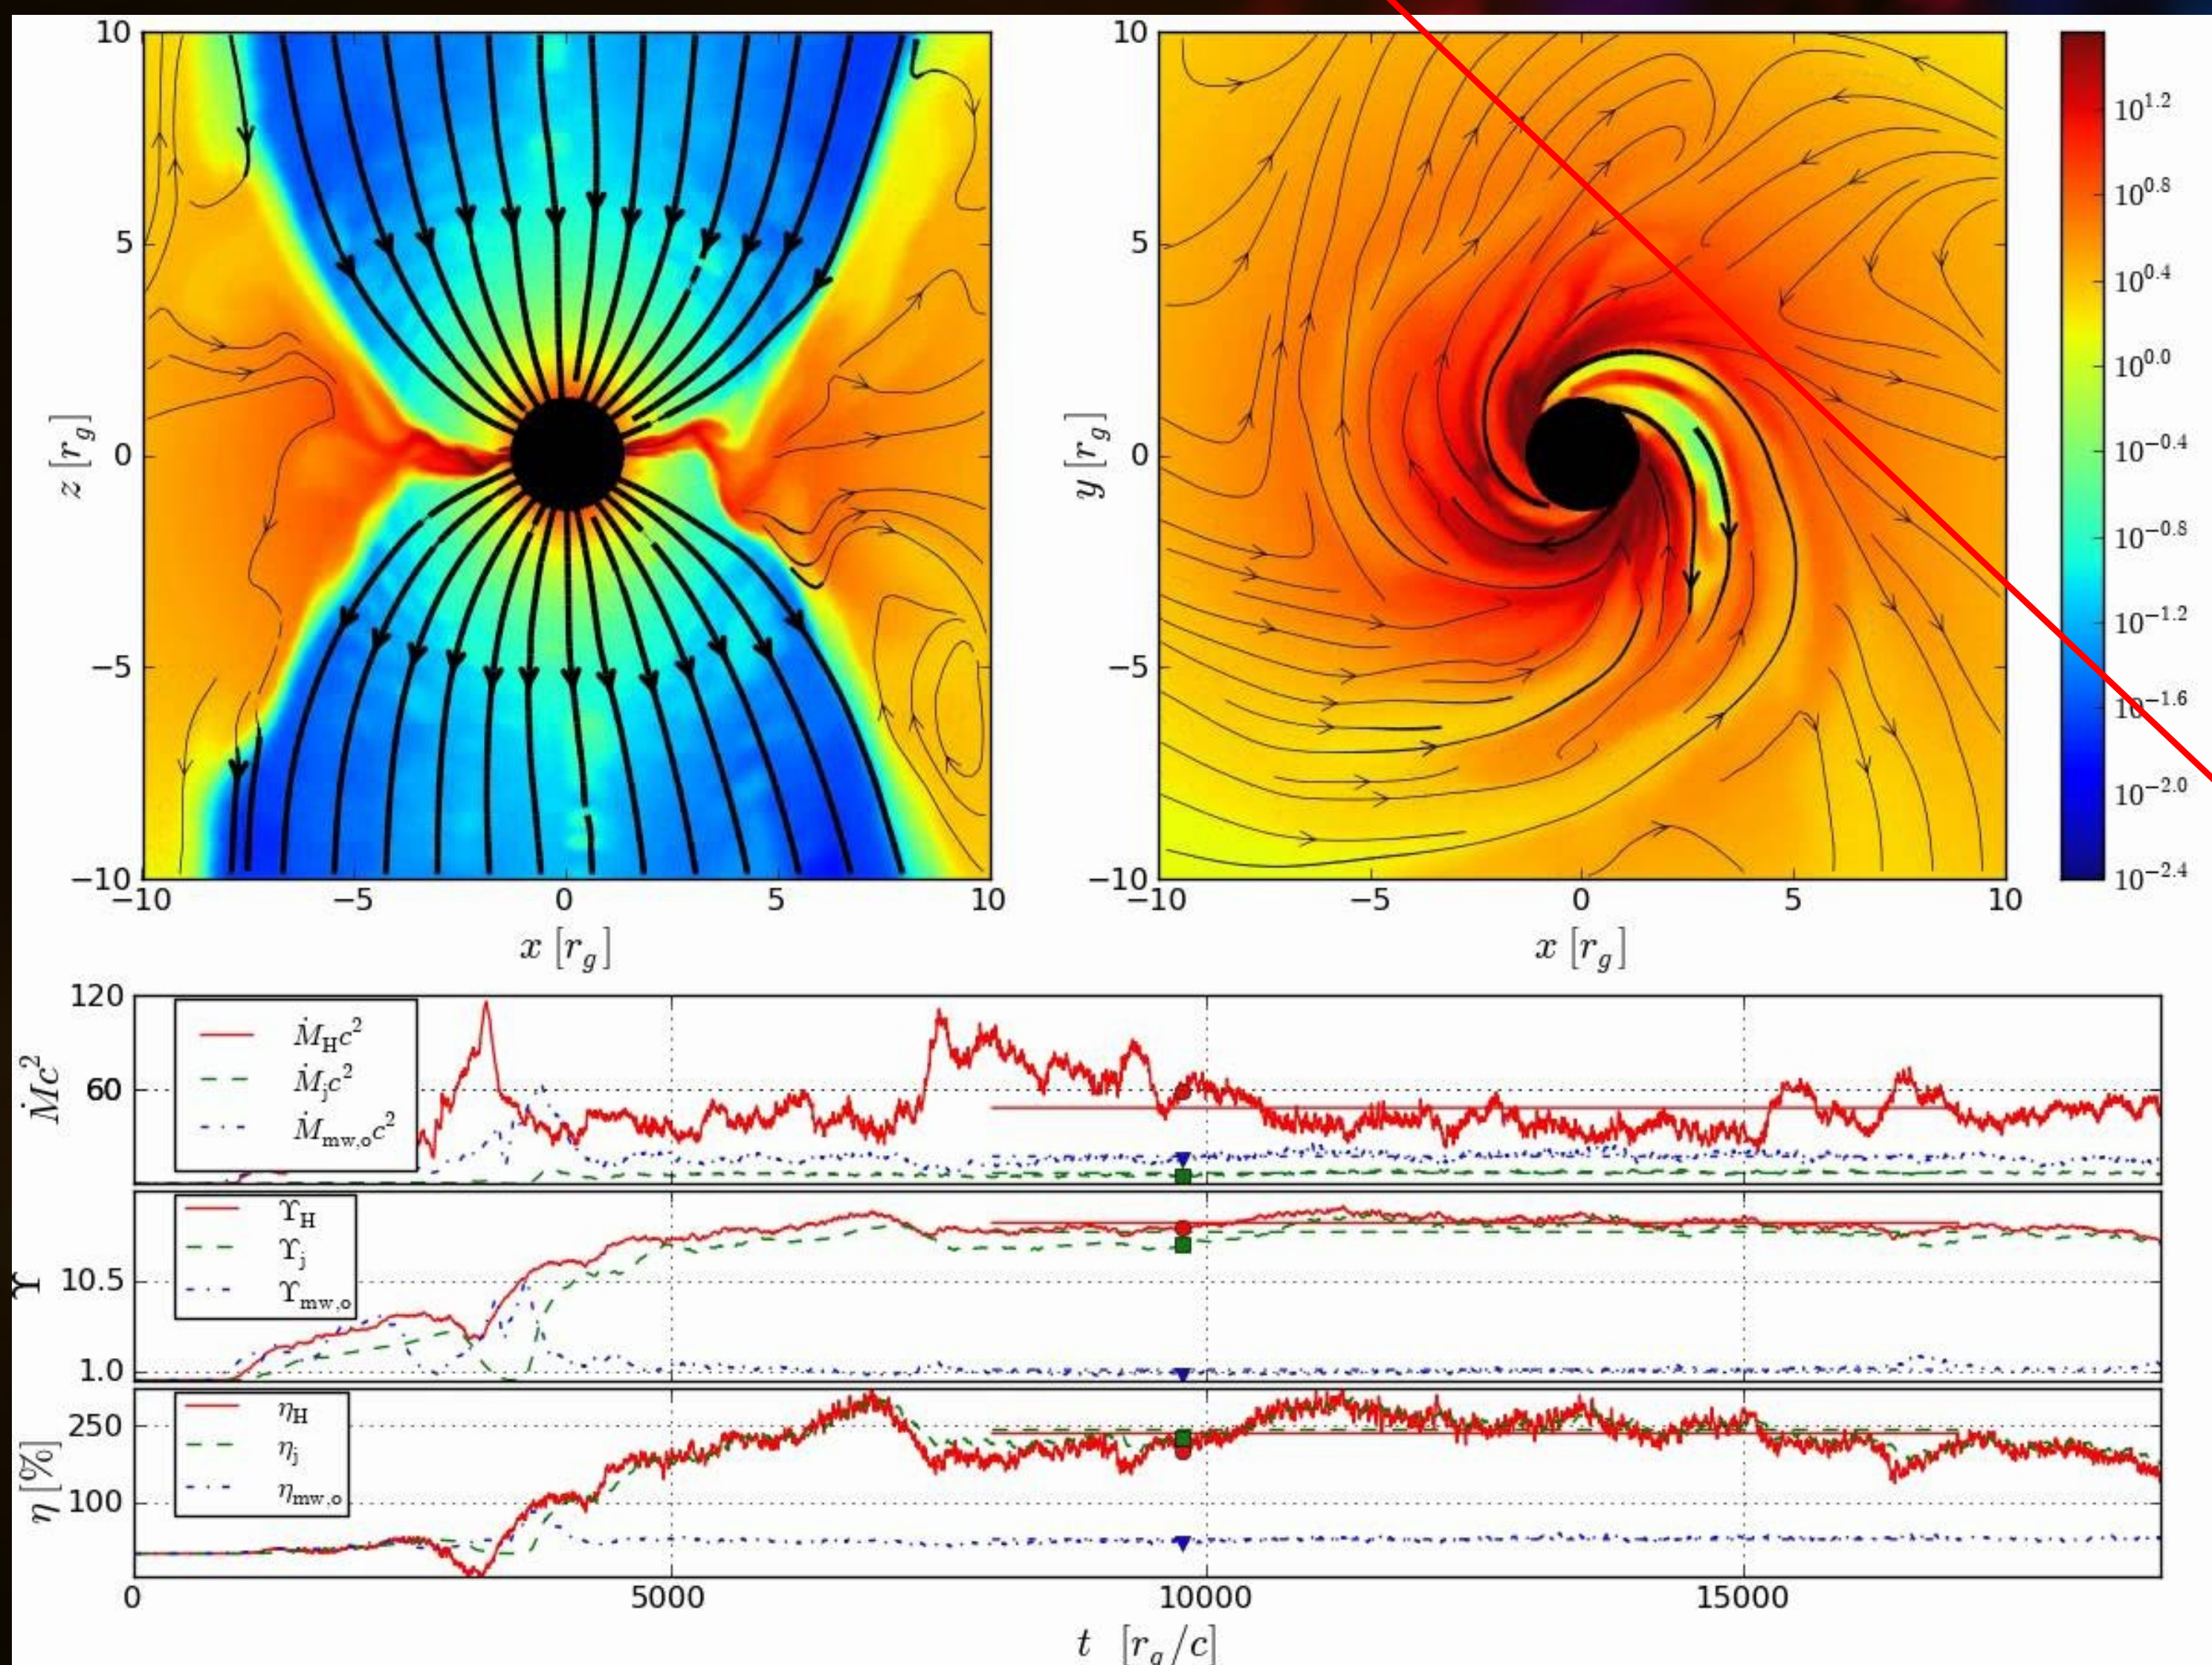

Galaxy System 3C 321  HUBBLESITE.org

Galaxy-SMBH connection: the numerical gap

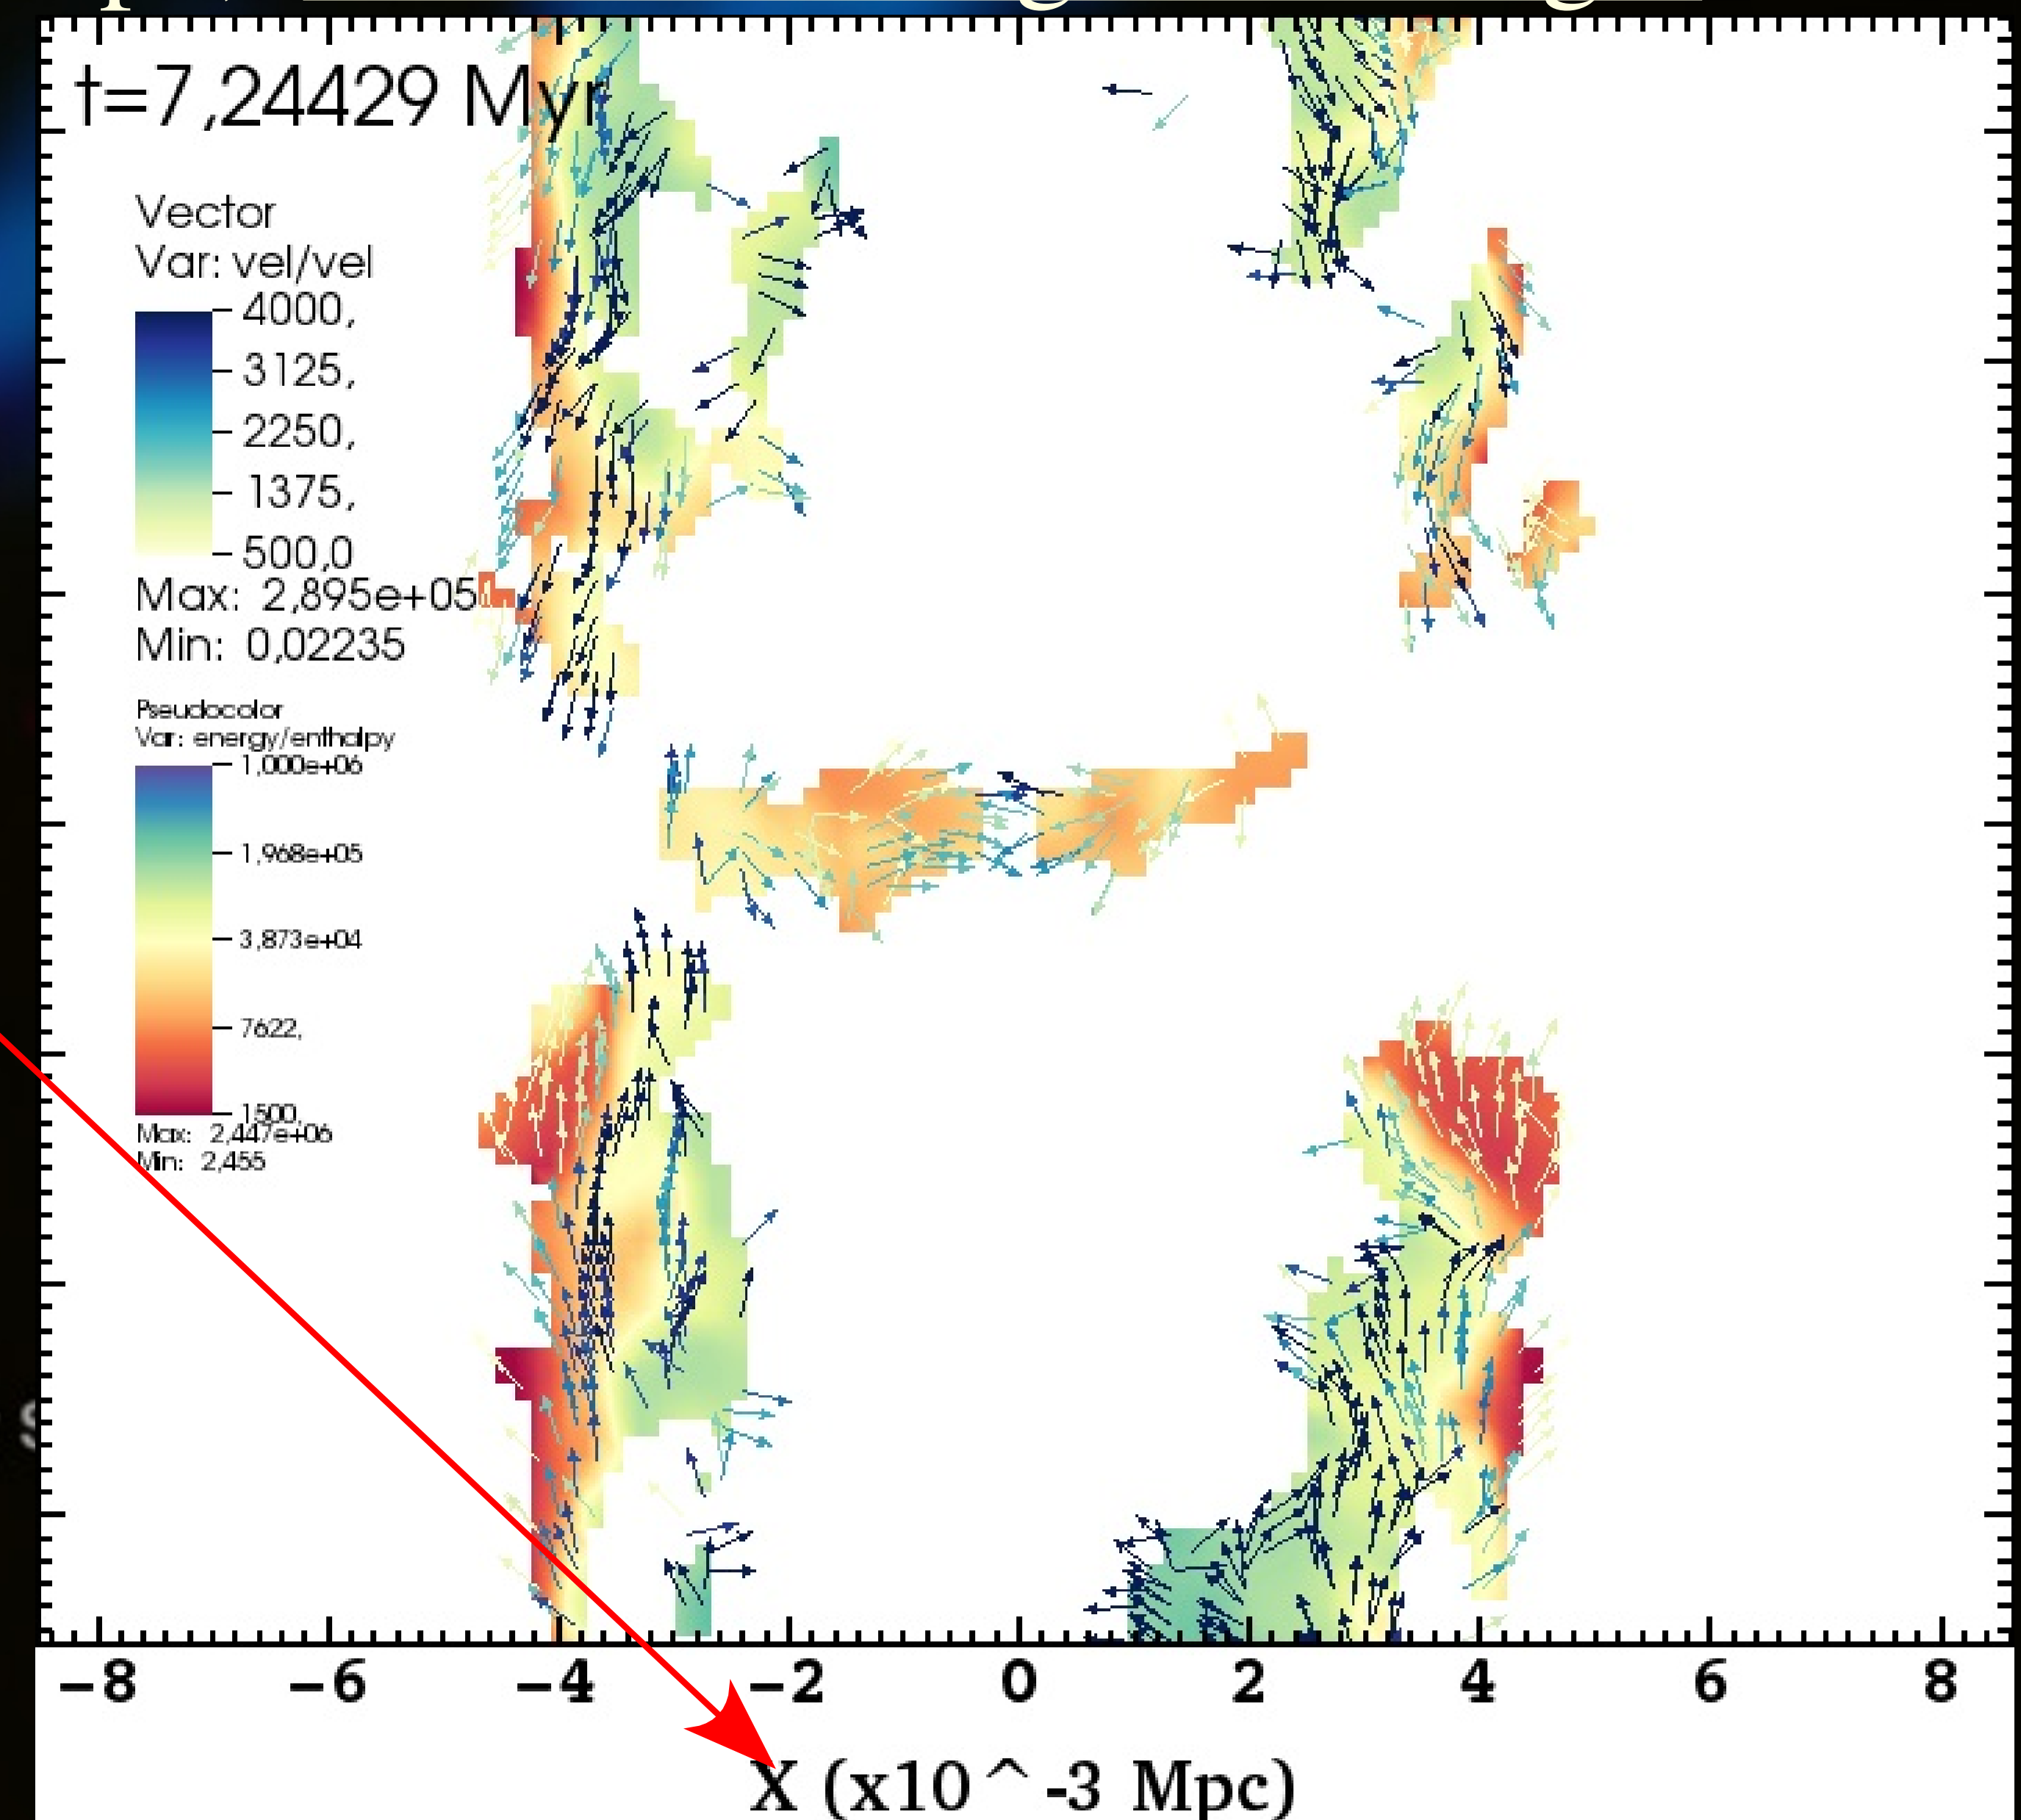

- Accretion/jet production region: $R_d \sim 10^3 r_g$ ($\sim 4.78 * 10^{-3}$ pc)

AMR (Gaspari, Brüggem, Fong, Bicknell, Wagner, Cielo+V.A.-D.,...):

$l_{\max}=10-15 \rightarrow R = L_{\text{box}}/2^{l_{\max}} \simeq 1.52 - 48.8$ pc, 3 orders of magnitude larger than R_d production

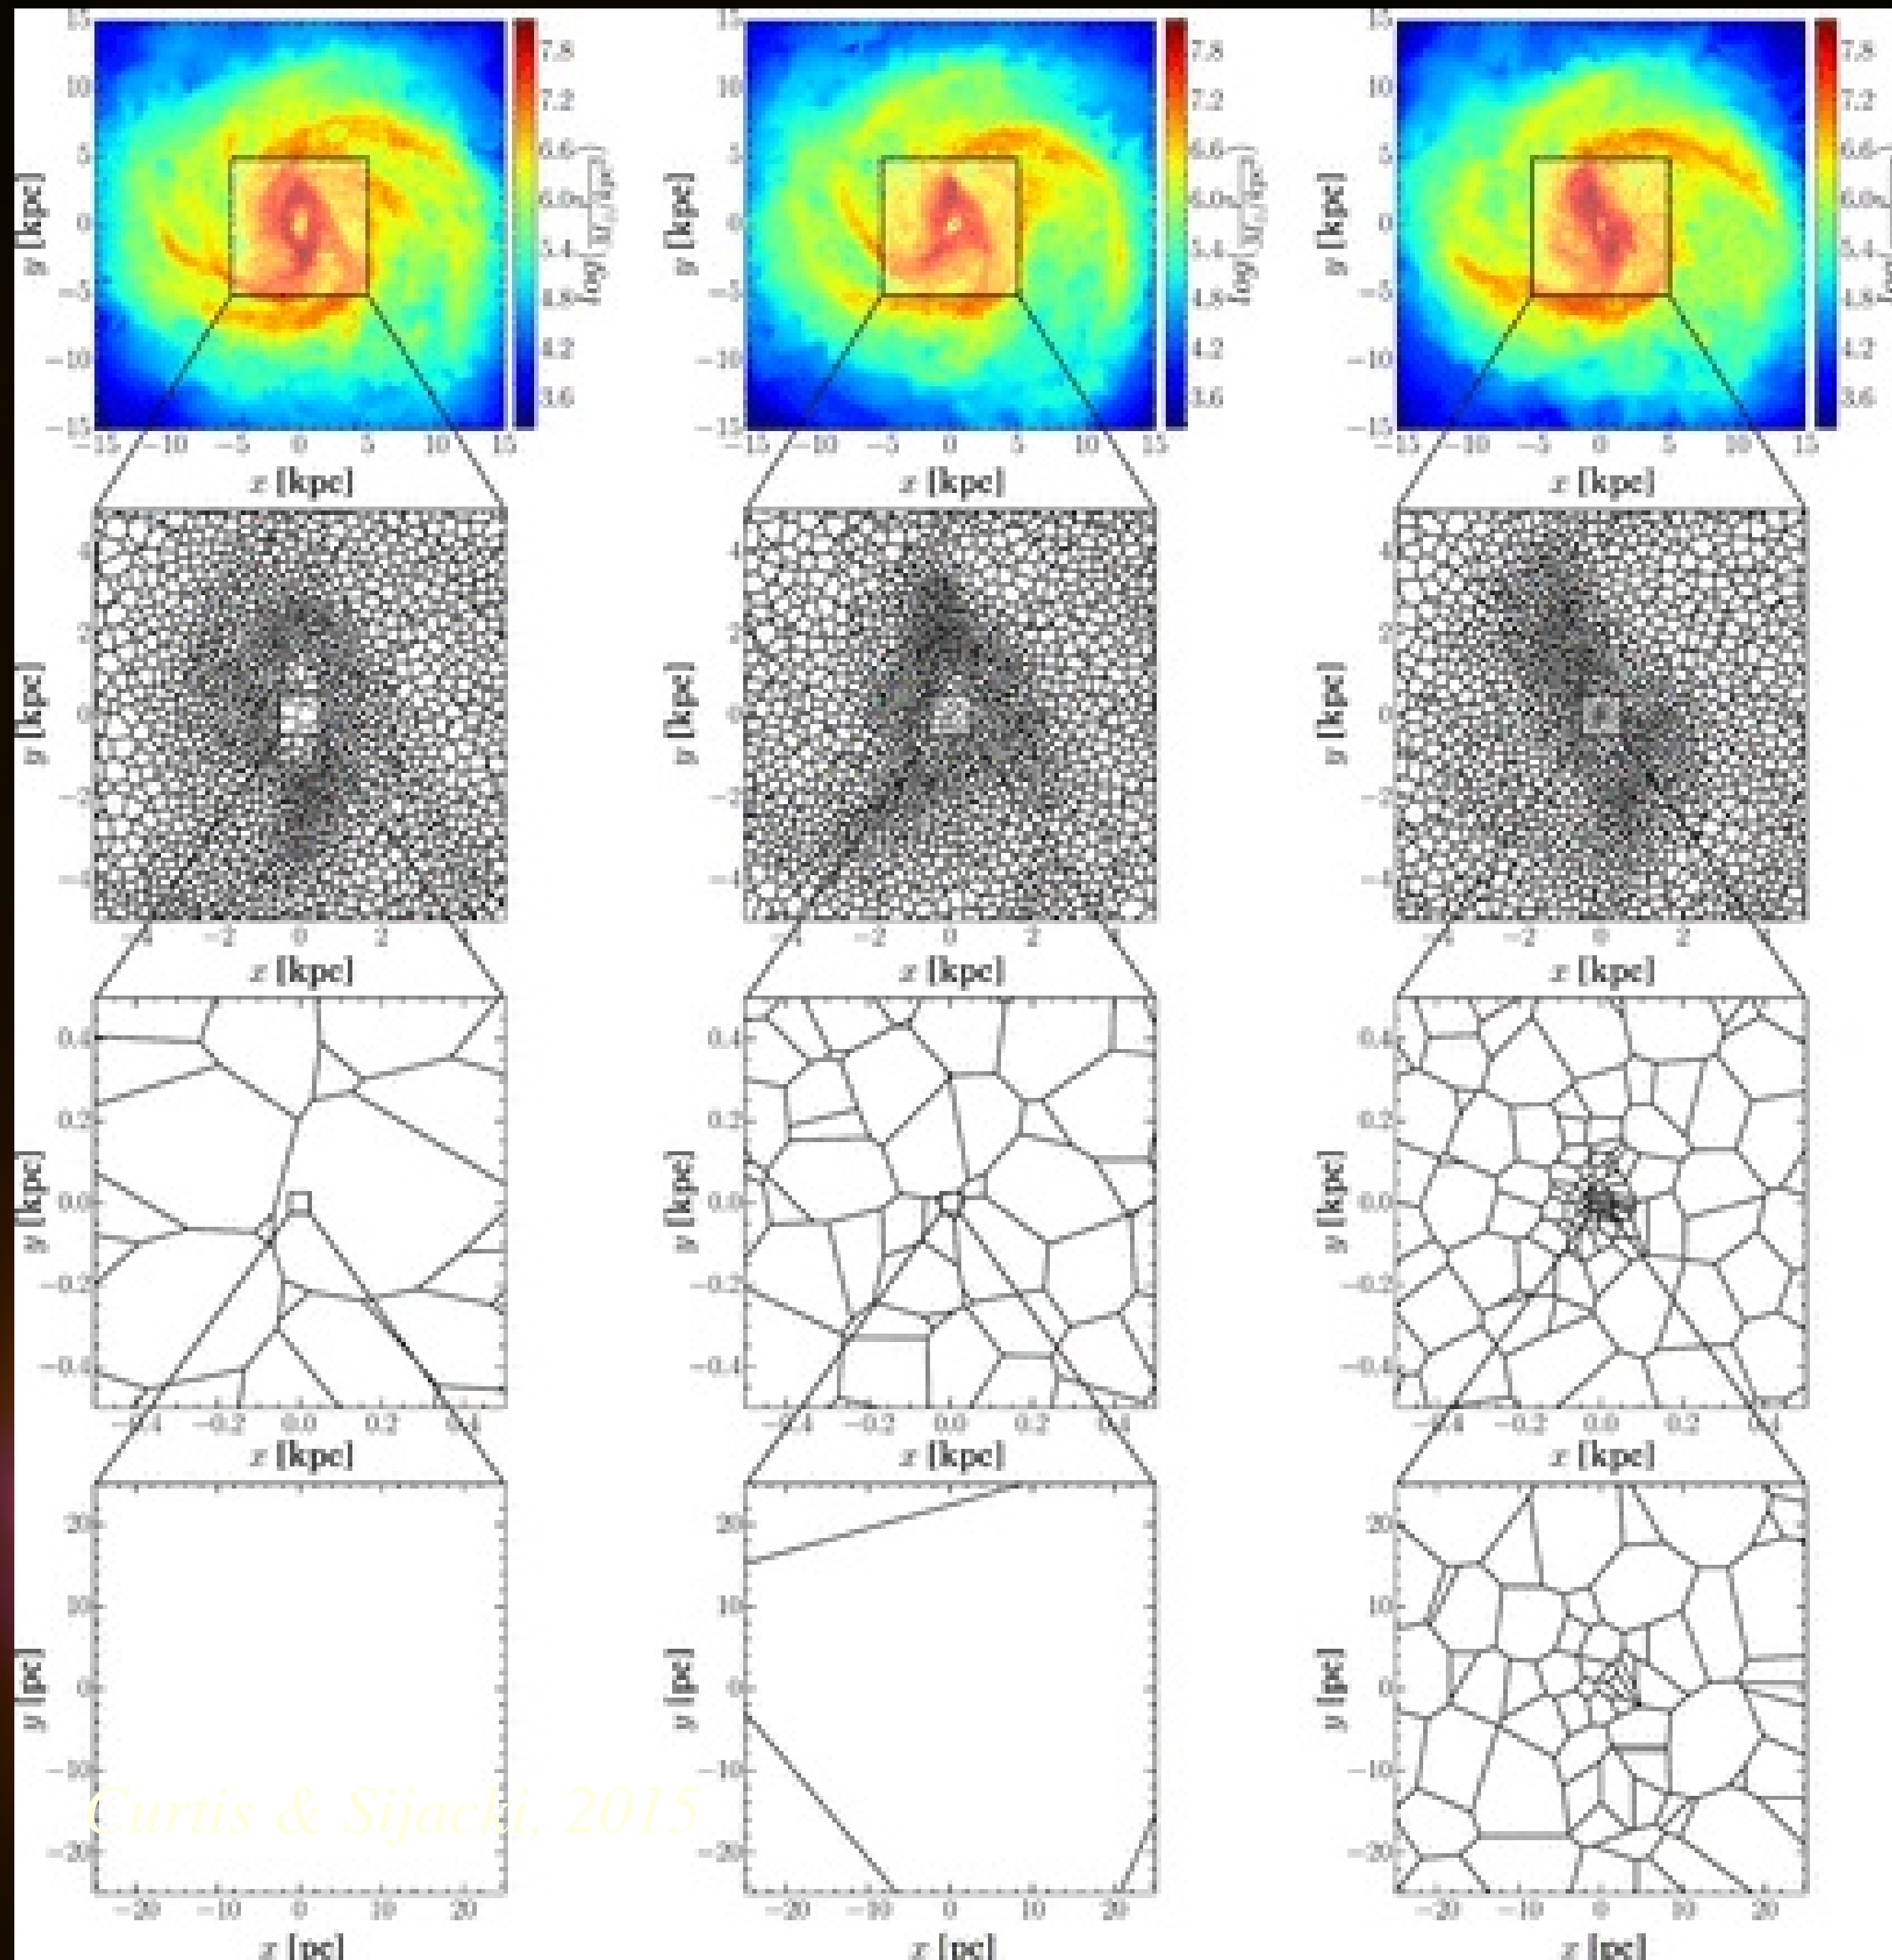

Tchekhovskoy et al., 2015

Cielo et al et al., 2015

Galaxy-SMBH connection: HOW TO FILL the numerical gap?

- AREPO (TreeSPH, *Springel*) + HPC parallel *simulations*

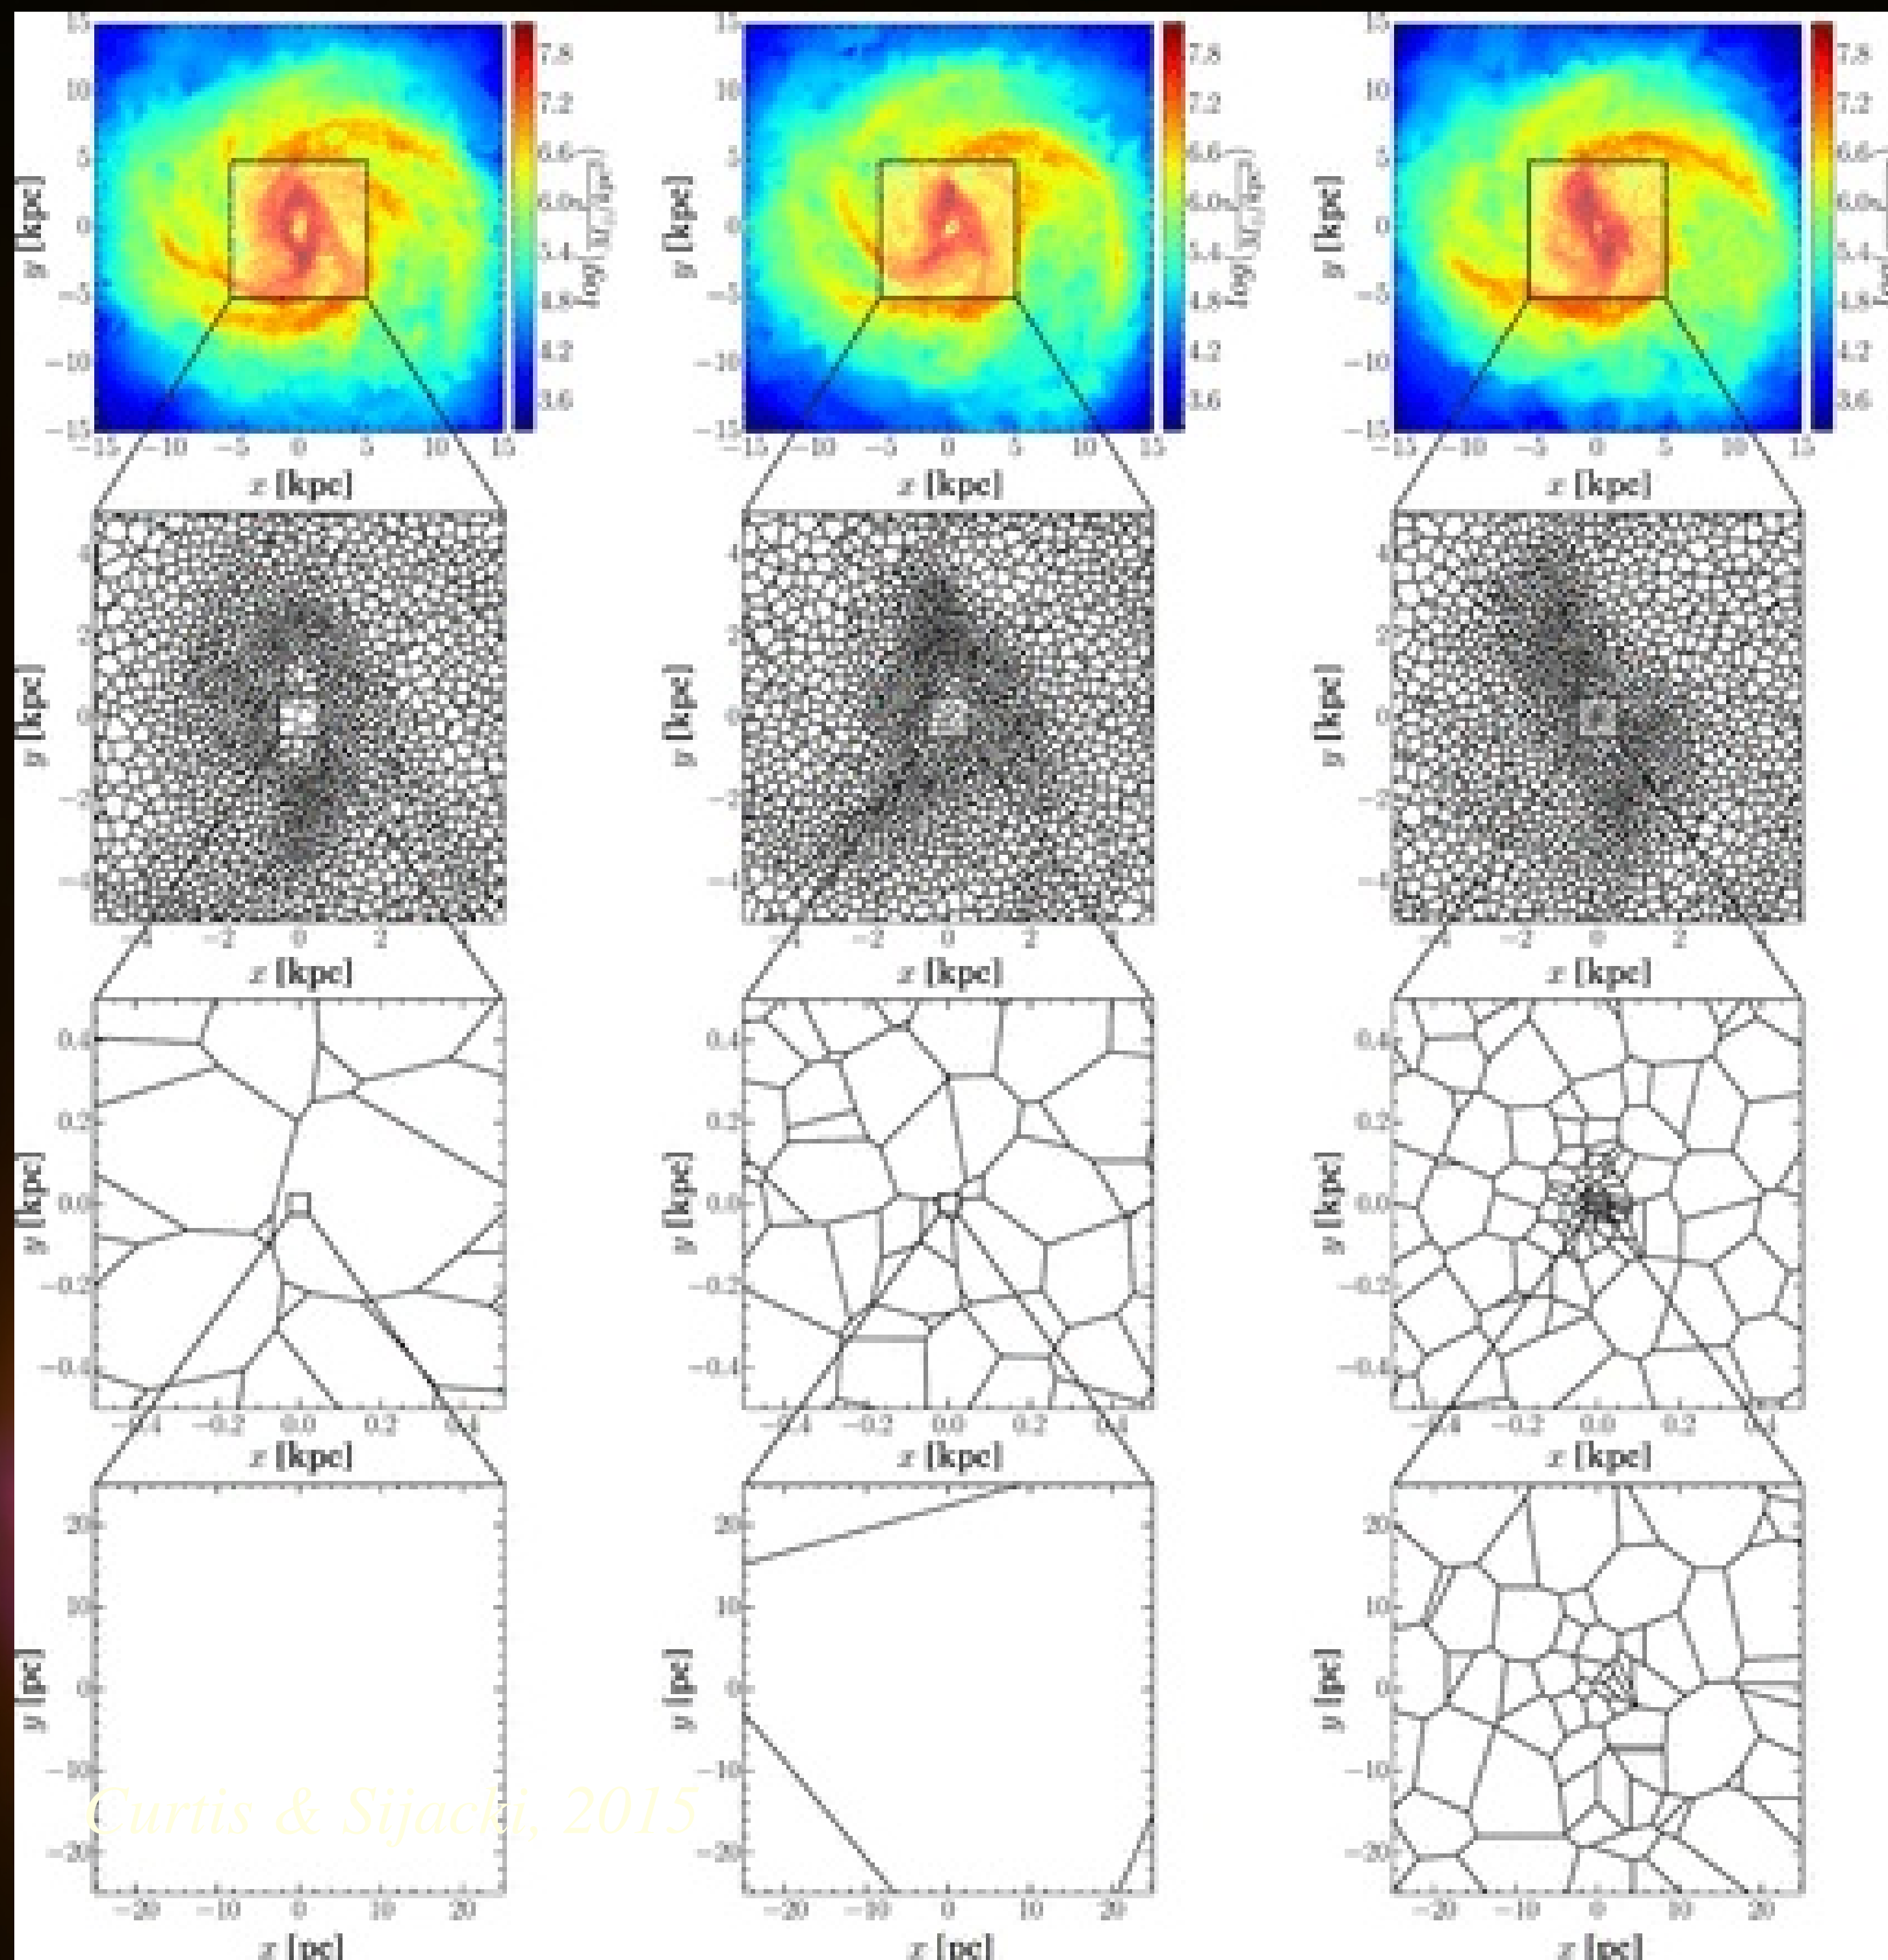

Curtis & Sijacki, 2015

System 3C 321  HUBBLESITE.org

Galaxy-SMBH connection: HOW TO FILL the numerical gap?

- AREPO (TreeSPH, *Springel*) + HPC parallel *simulations*

→ Resolves accretion region ($\sim 10^4 r_g$) within a single galaxy

Curtis & Sijacki, 2015

System 3C 321  HUBBLESITE.org

Galaxy-SMBH connection: HOW TO FILL the numerical gap?

- AREPO (TreeSPH, *Springel*) + HPC parallel *simulations*

→ Resolves accretion region ($\sim 10^4 r_g$) within a single galaxy

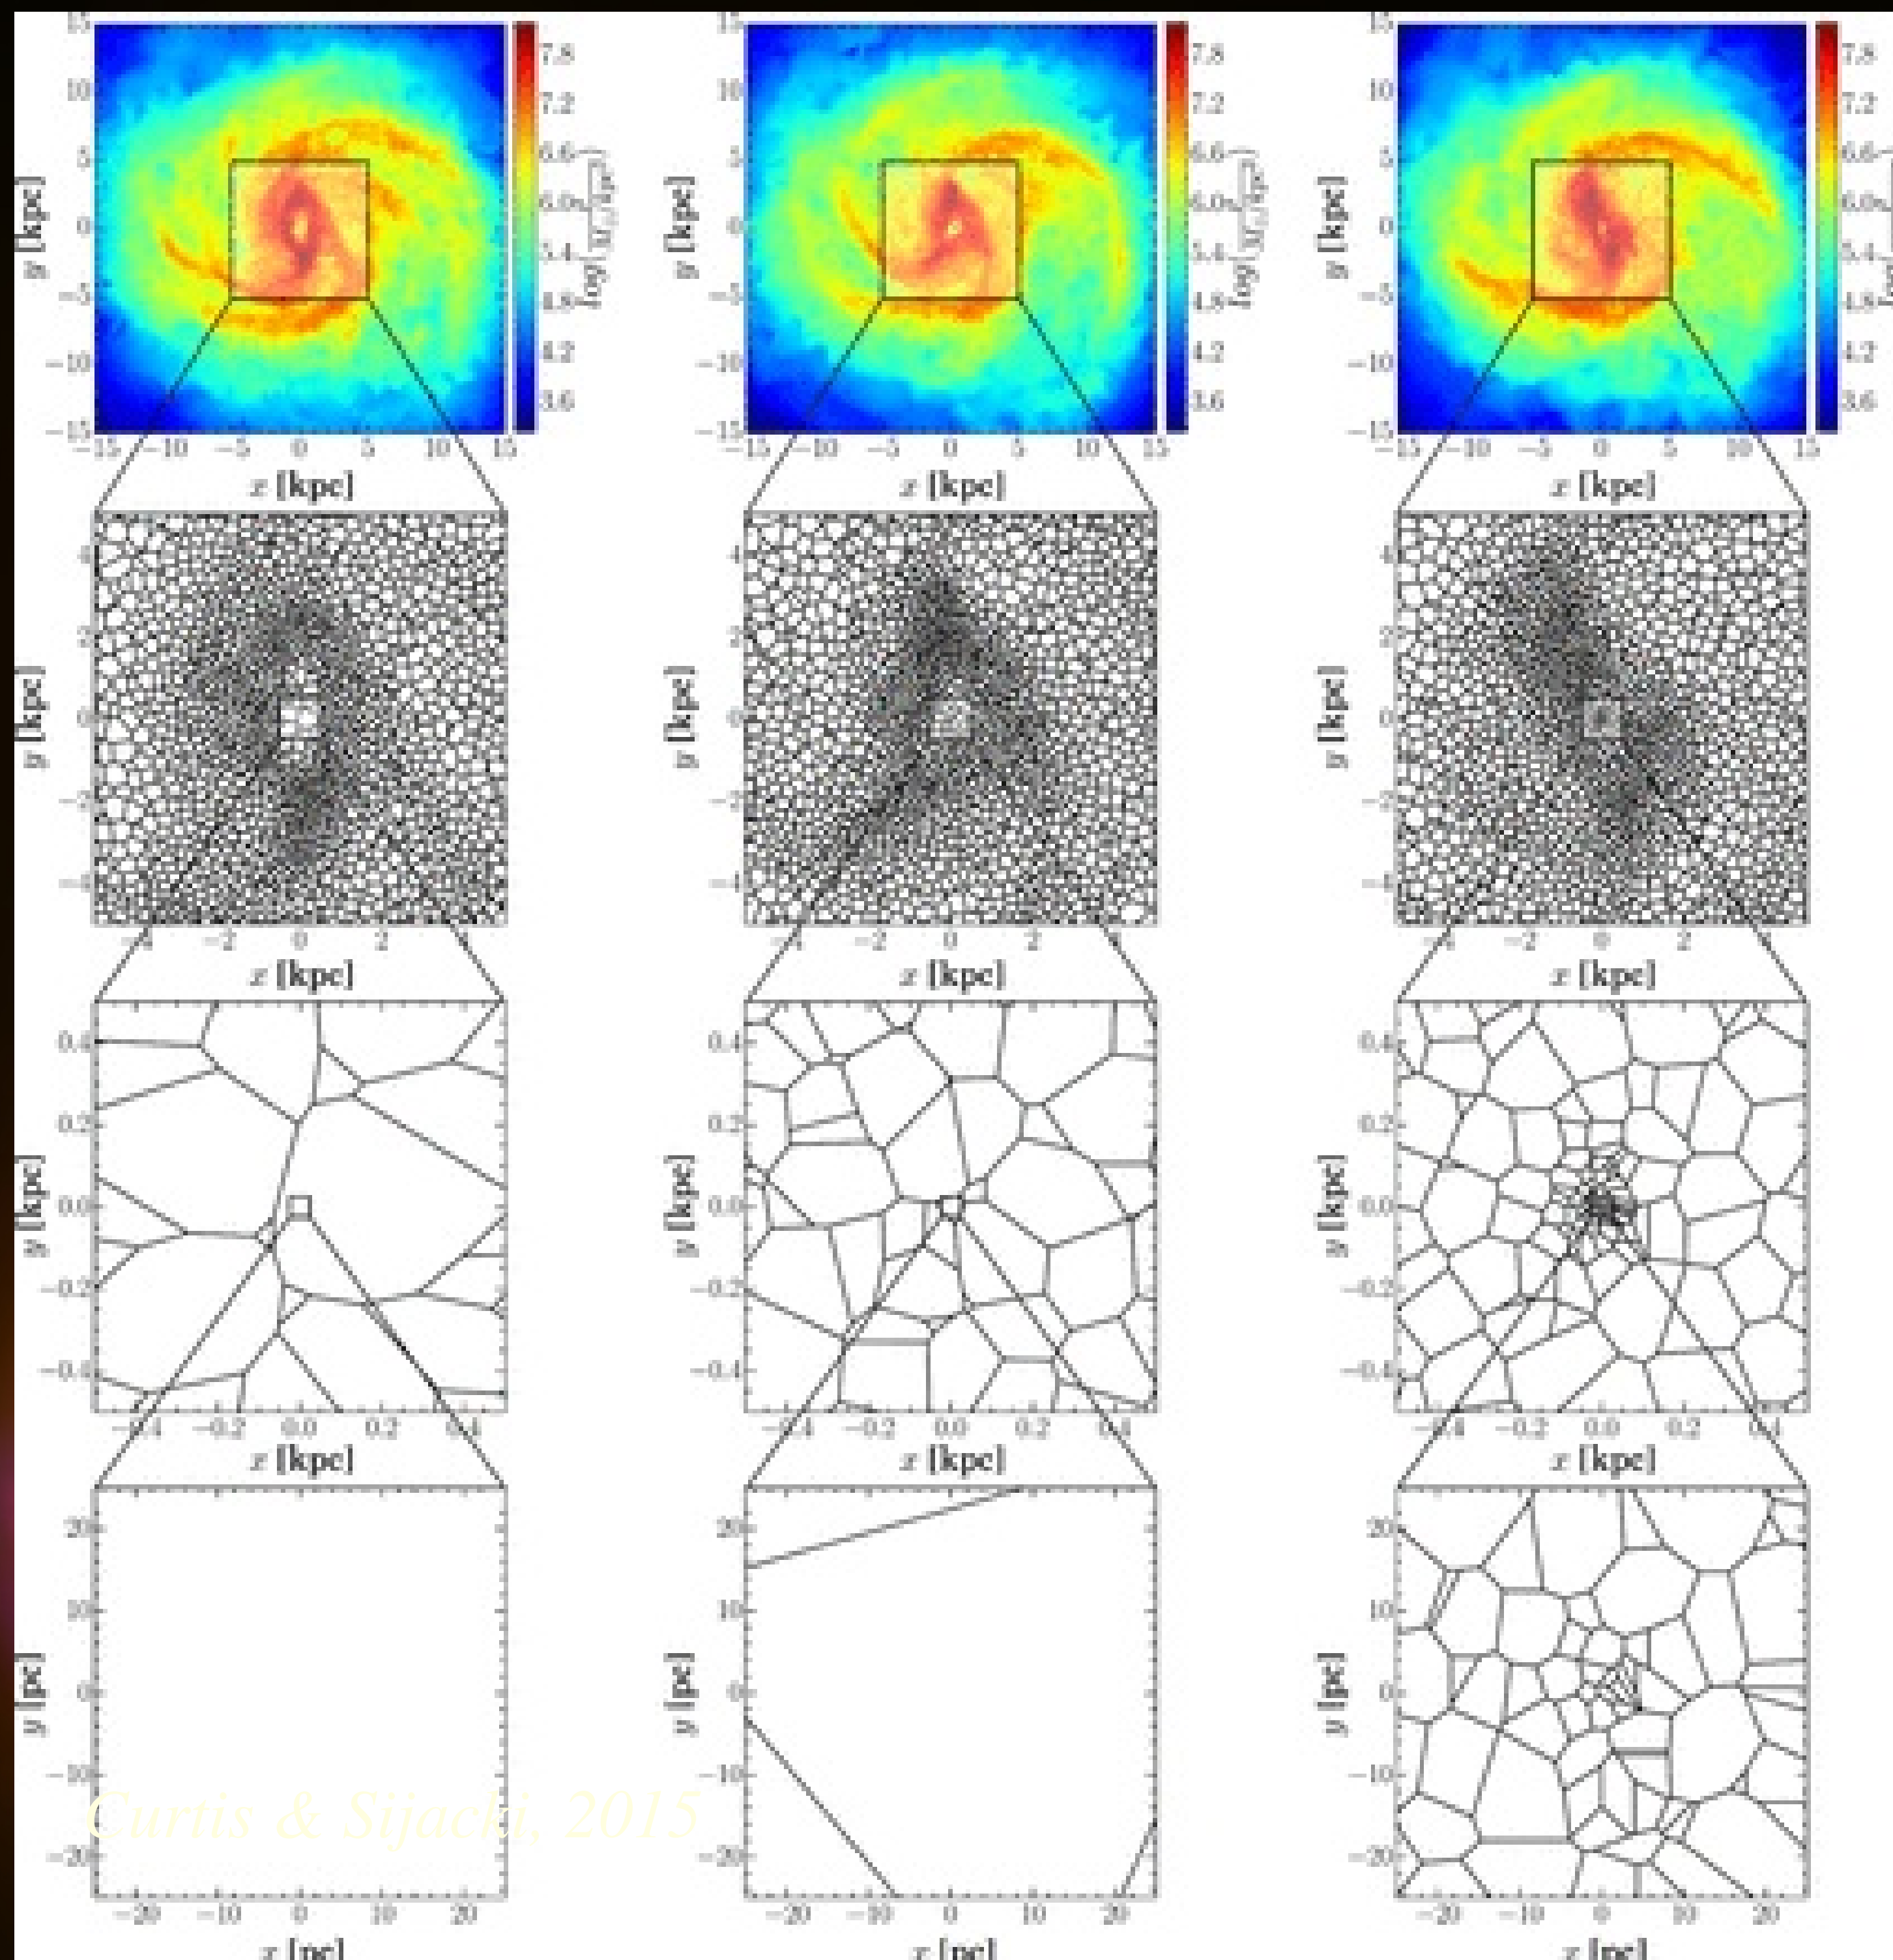

- High resolution → backflows from the large-scale jet are resolved

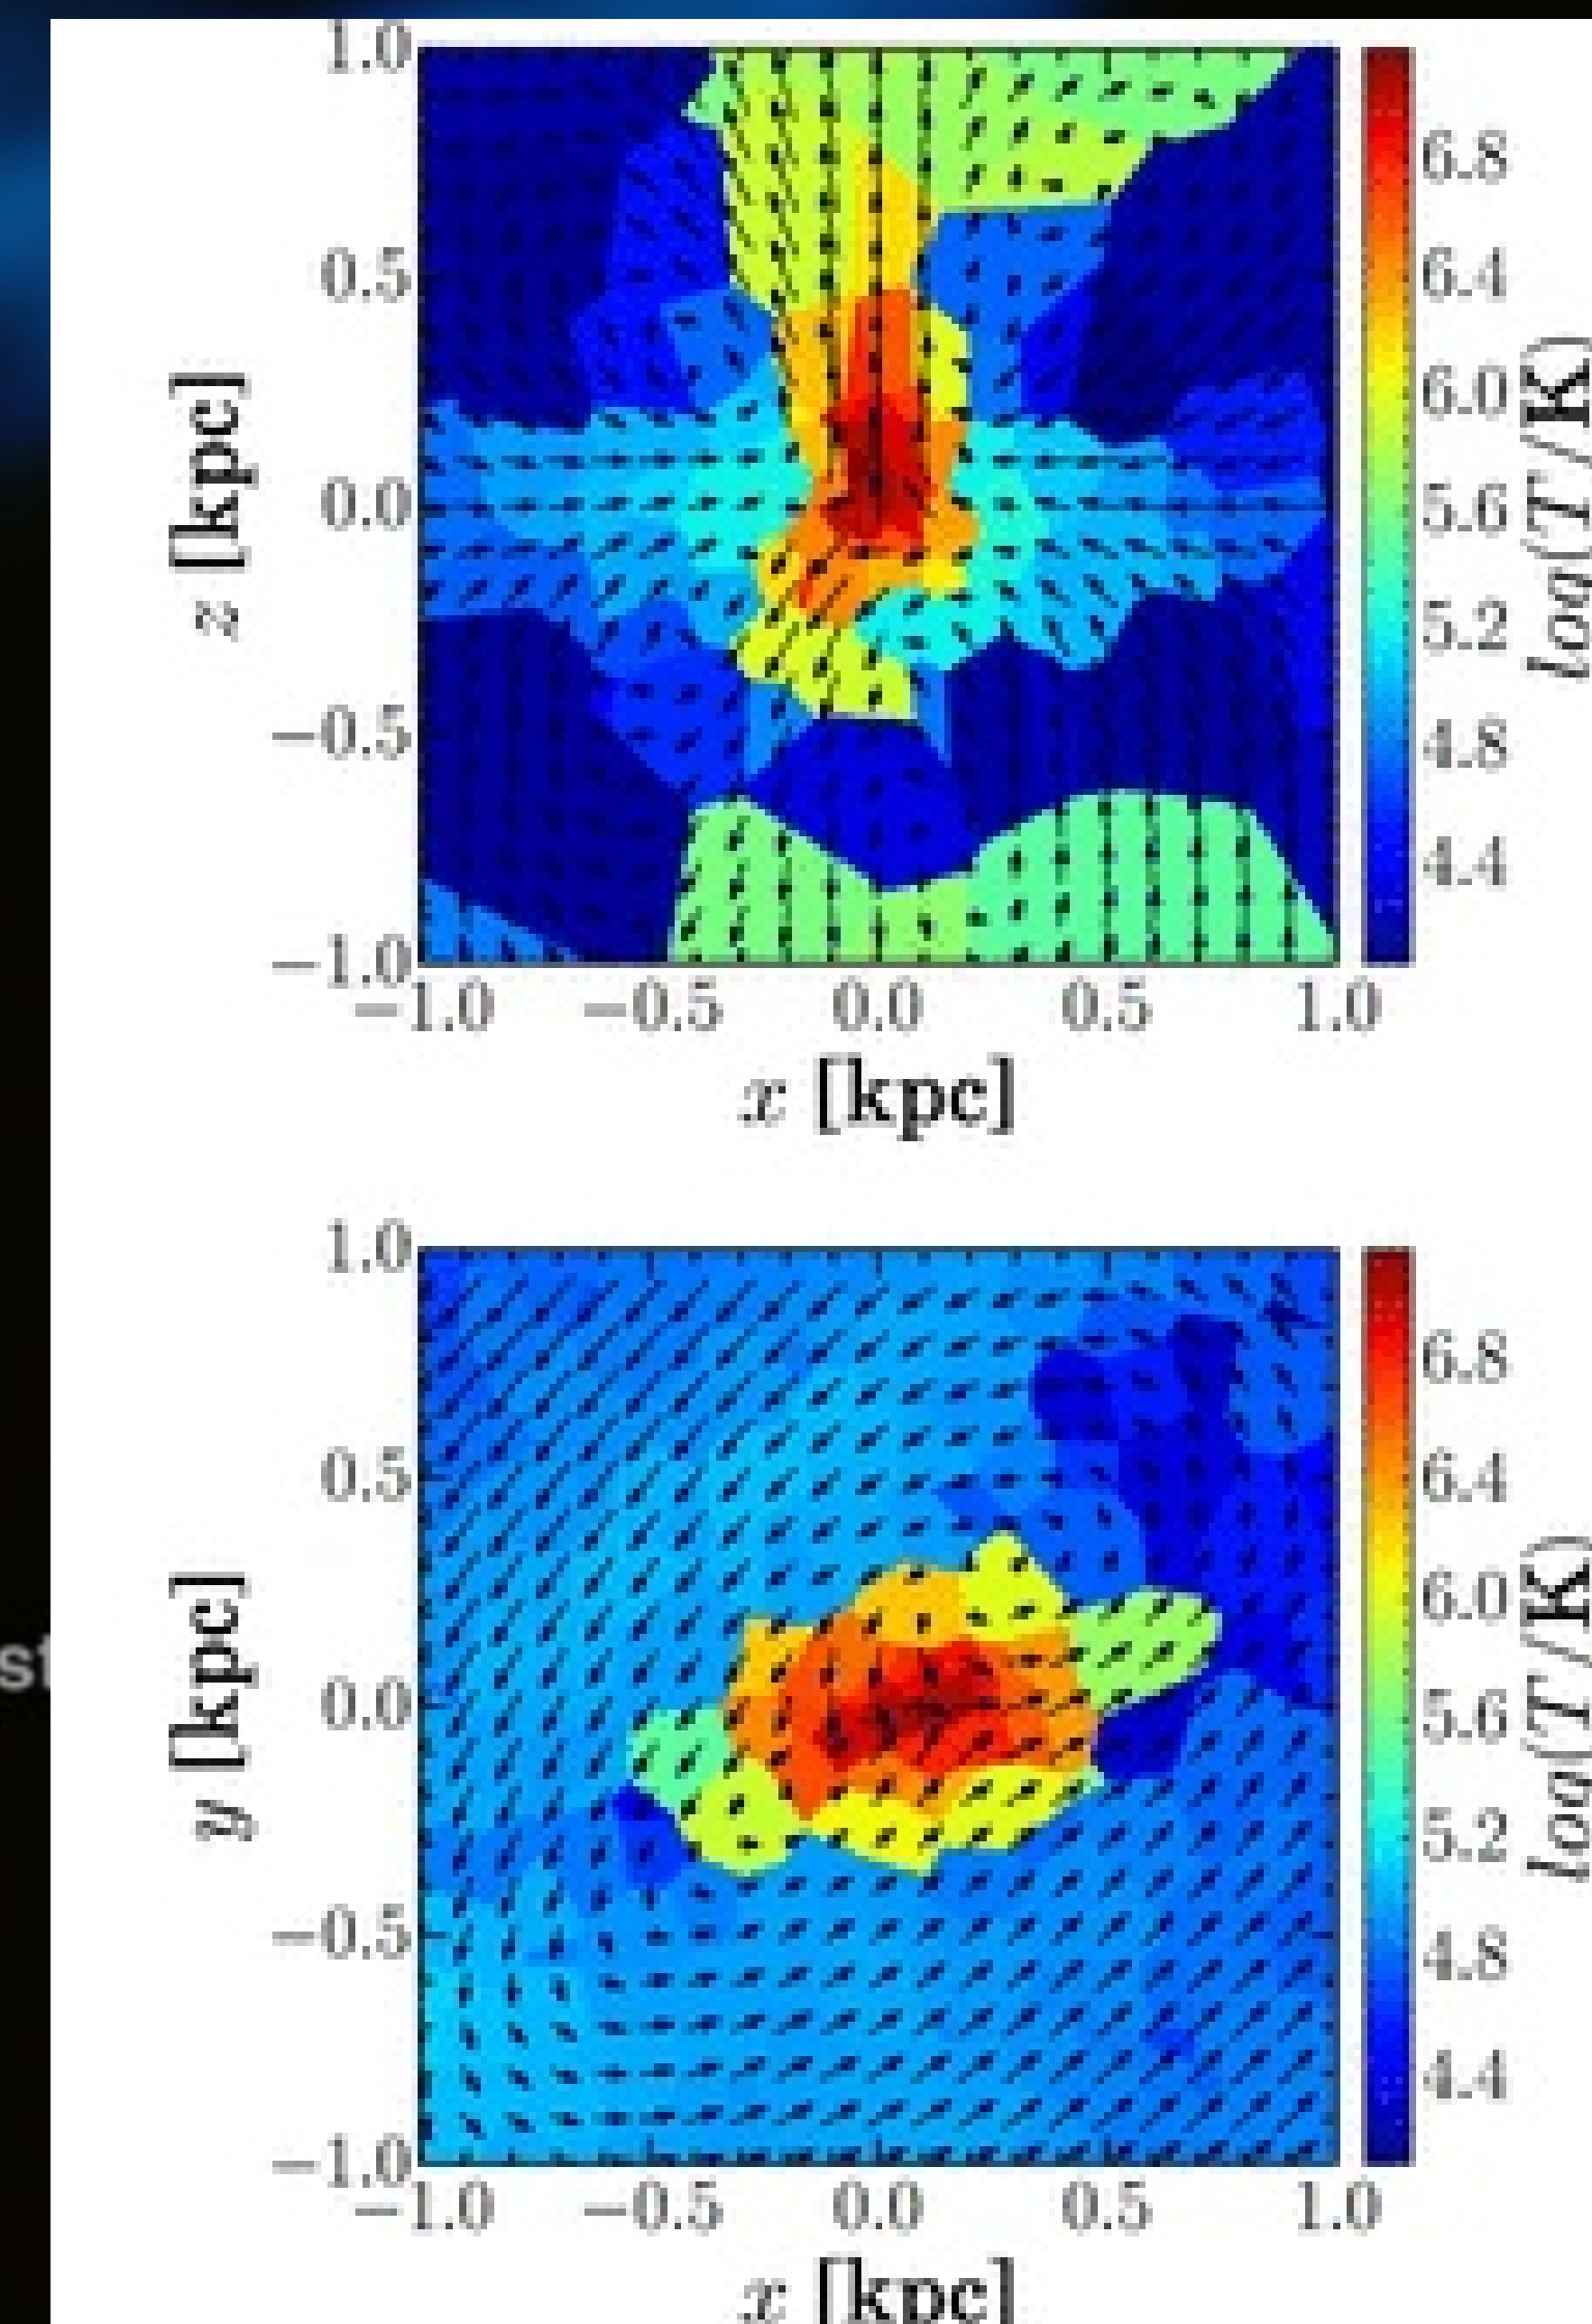

Galaxy-SMBH connection: HOW TO FILL the numerical gap?

- AREPO (TreeSPH, *Springel*) + HPC parallel *simulations*

→ Resolves accretion region ($\sim 10^4 r_g$) within a single galaxy

Positive feedback lasts lesser than quenching.....

Is positive feedback cosmologically relevant to galaxy stellar formation @ $z \gtrsim 2$?

Powerful Jet from a Supermassive Black Hole in Galaxy System 3C 321  HUBBLESITE.org

Is positive feedback cosmologically relevant to galaxy stellar formation @ $z \gtrsim 2$?

Only modelling (incl. *numerical experiments*) can provide us with unbiased , realistic hints.

Backflows within AGNs relativistic jets:
The link between large- and subparsec scale feedback

Powerful Jet from a Supermassive Black Hole in Galaxy System 3C 321  HUBBLESITE.org

Backflows within AGNs relativistic jets: The link between large- and subparsec scale feedback

Backflow: gas streaming opposite to and along the boundary of the cocoon.

Backflows within AGNs relativistic jets: The link between large- and subparsec scale feedback

Backflow: gas streaming opposite to and along the boundary of the cocoon.

- Origin is thermodynamical : vorticity is produced from jet's gas crossing the shock before the **Hot Spot**

Backflows within AGNs relativistic jets: The link between large- and subparsec scale feedback

Backflow: gas streaming opposite to and along the boundary of the cocoon.

- Origin is thermodynamical : vorticity is produced from jet's gas crossing the shock before the **Hot Spot**

Powerful Jet from a Supermassive Black Hole in Galaxy System 3C 321  HUBBLESITE.org

- Backflow is spatially coherent and intrinsically axisymmetric all way down to the accretion region

Backflows within AGNs relativistic jets: The link between large- and subparsec scale feedback

Backflow: gas streaming opposite to and along the boundary of the cocoon.

- Origin is thermodynamical : vorticity is produced from jet's gas crossing the shock before the **Hot Spot**

Powerful Jet from a Supermassive Black Hole in Galaxy System 3C 321  HUBBLESITE.org

- Backflow is spatially coherent and intrinsically axisymmetric all way down to the accretion region
- Backflow drives low- L_z gas into the SMBH accretion region

Observational evidence for backflows

Observational evidence for backflows

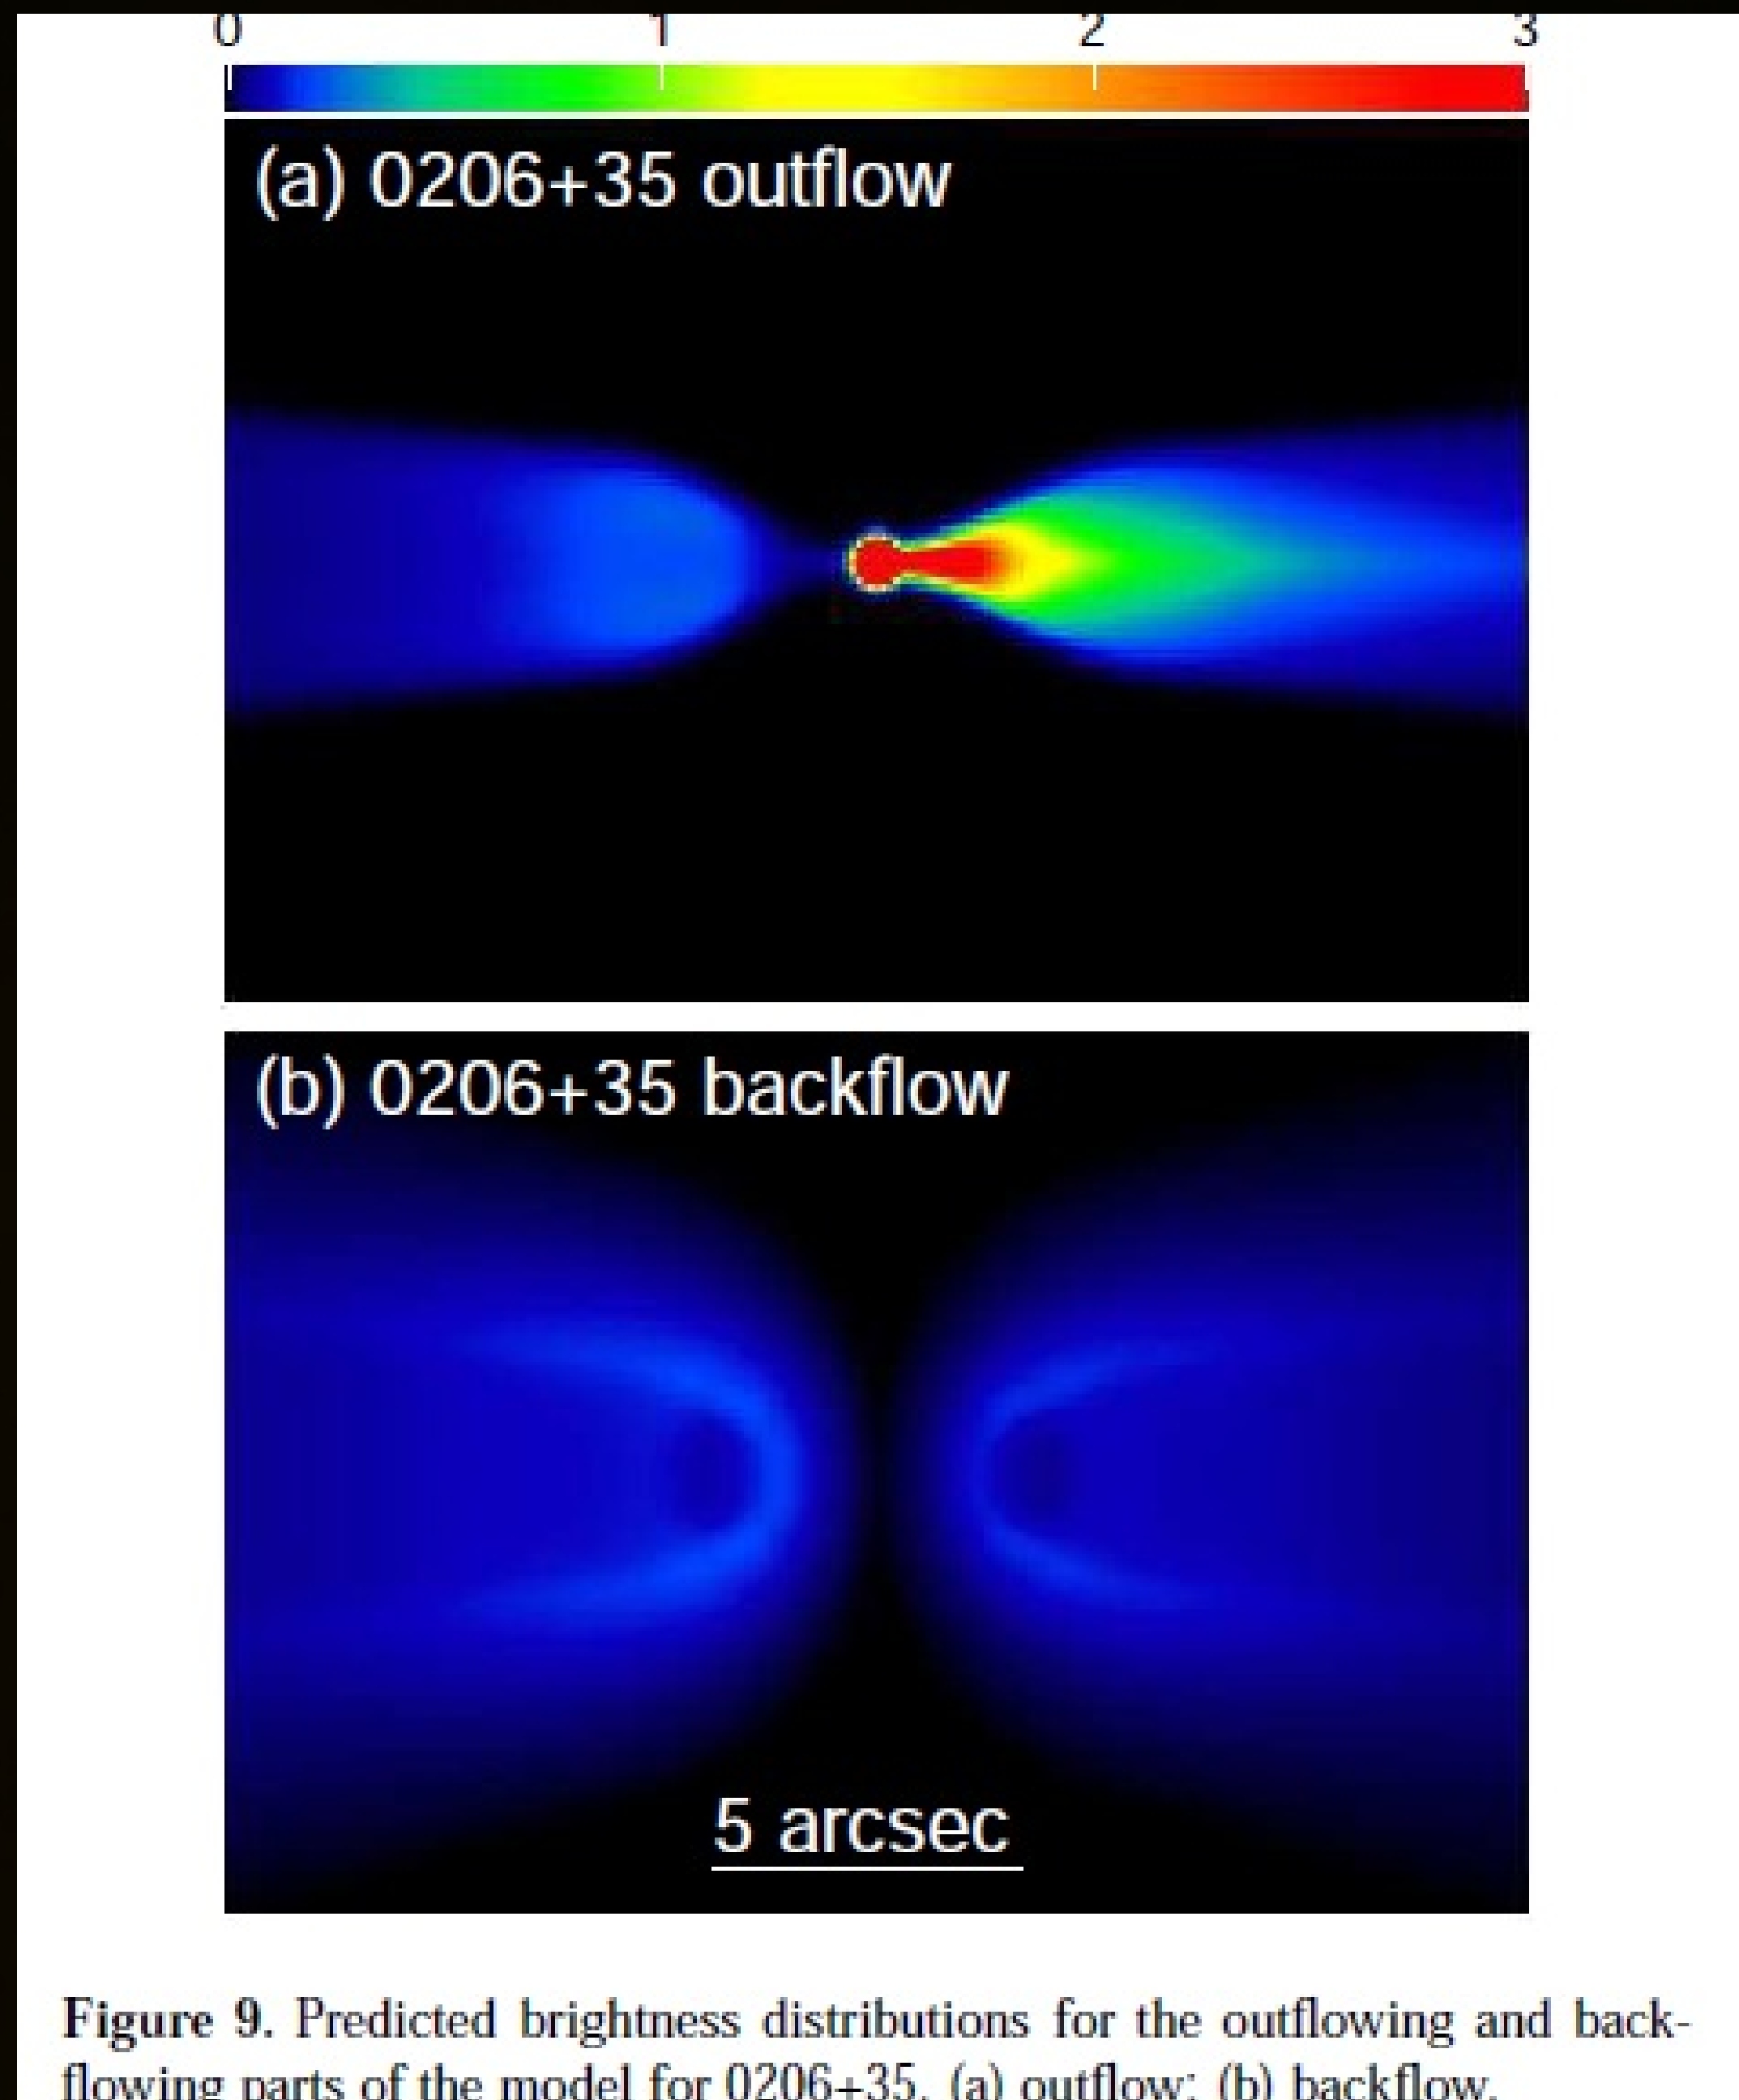

Figure 9. Predicted brightness distributions for the outflowing and back-flowing parts of the model for 0206+35. (a) outflow; (b) backflow.

Laing & Bridle, 2012: FRI, mildly relativistic velocities

Neumayer et al, 2007: CEN A
Deeper analysis with MUSE: Hamer et al., 2015

Numerical experiments

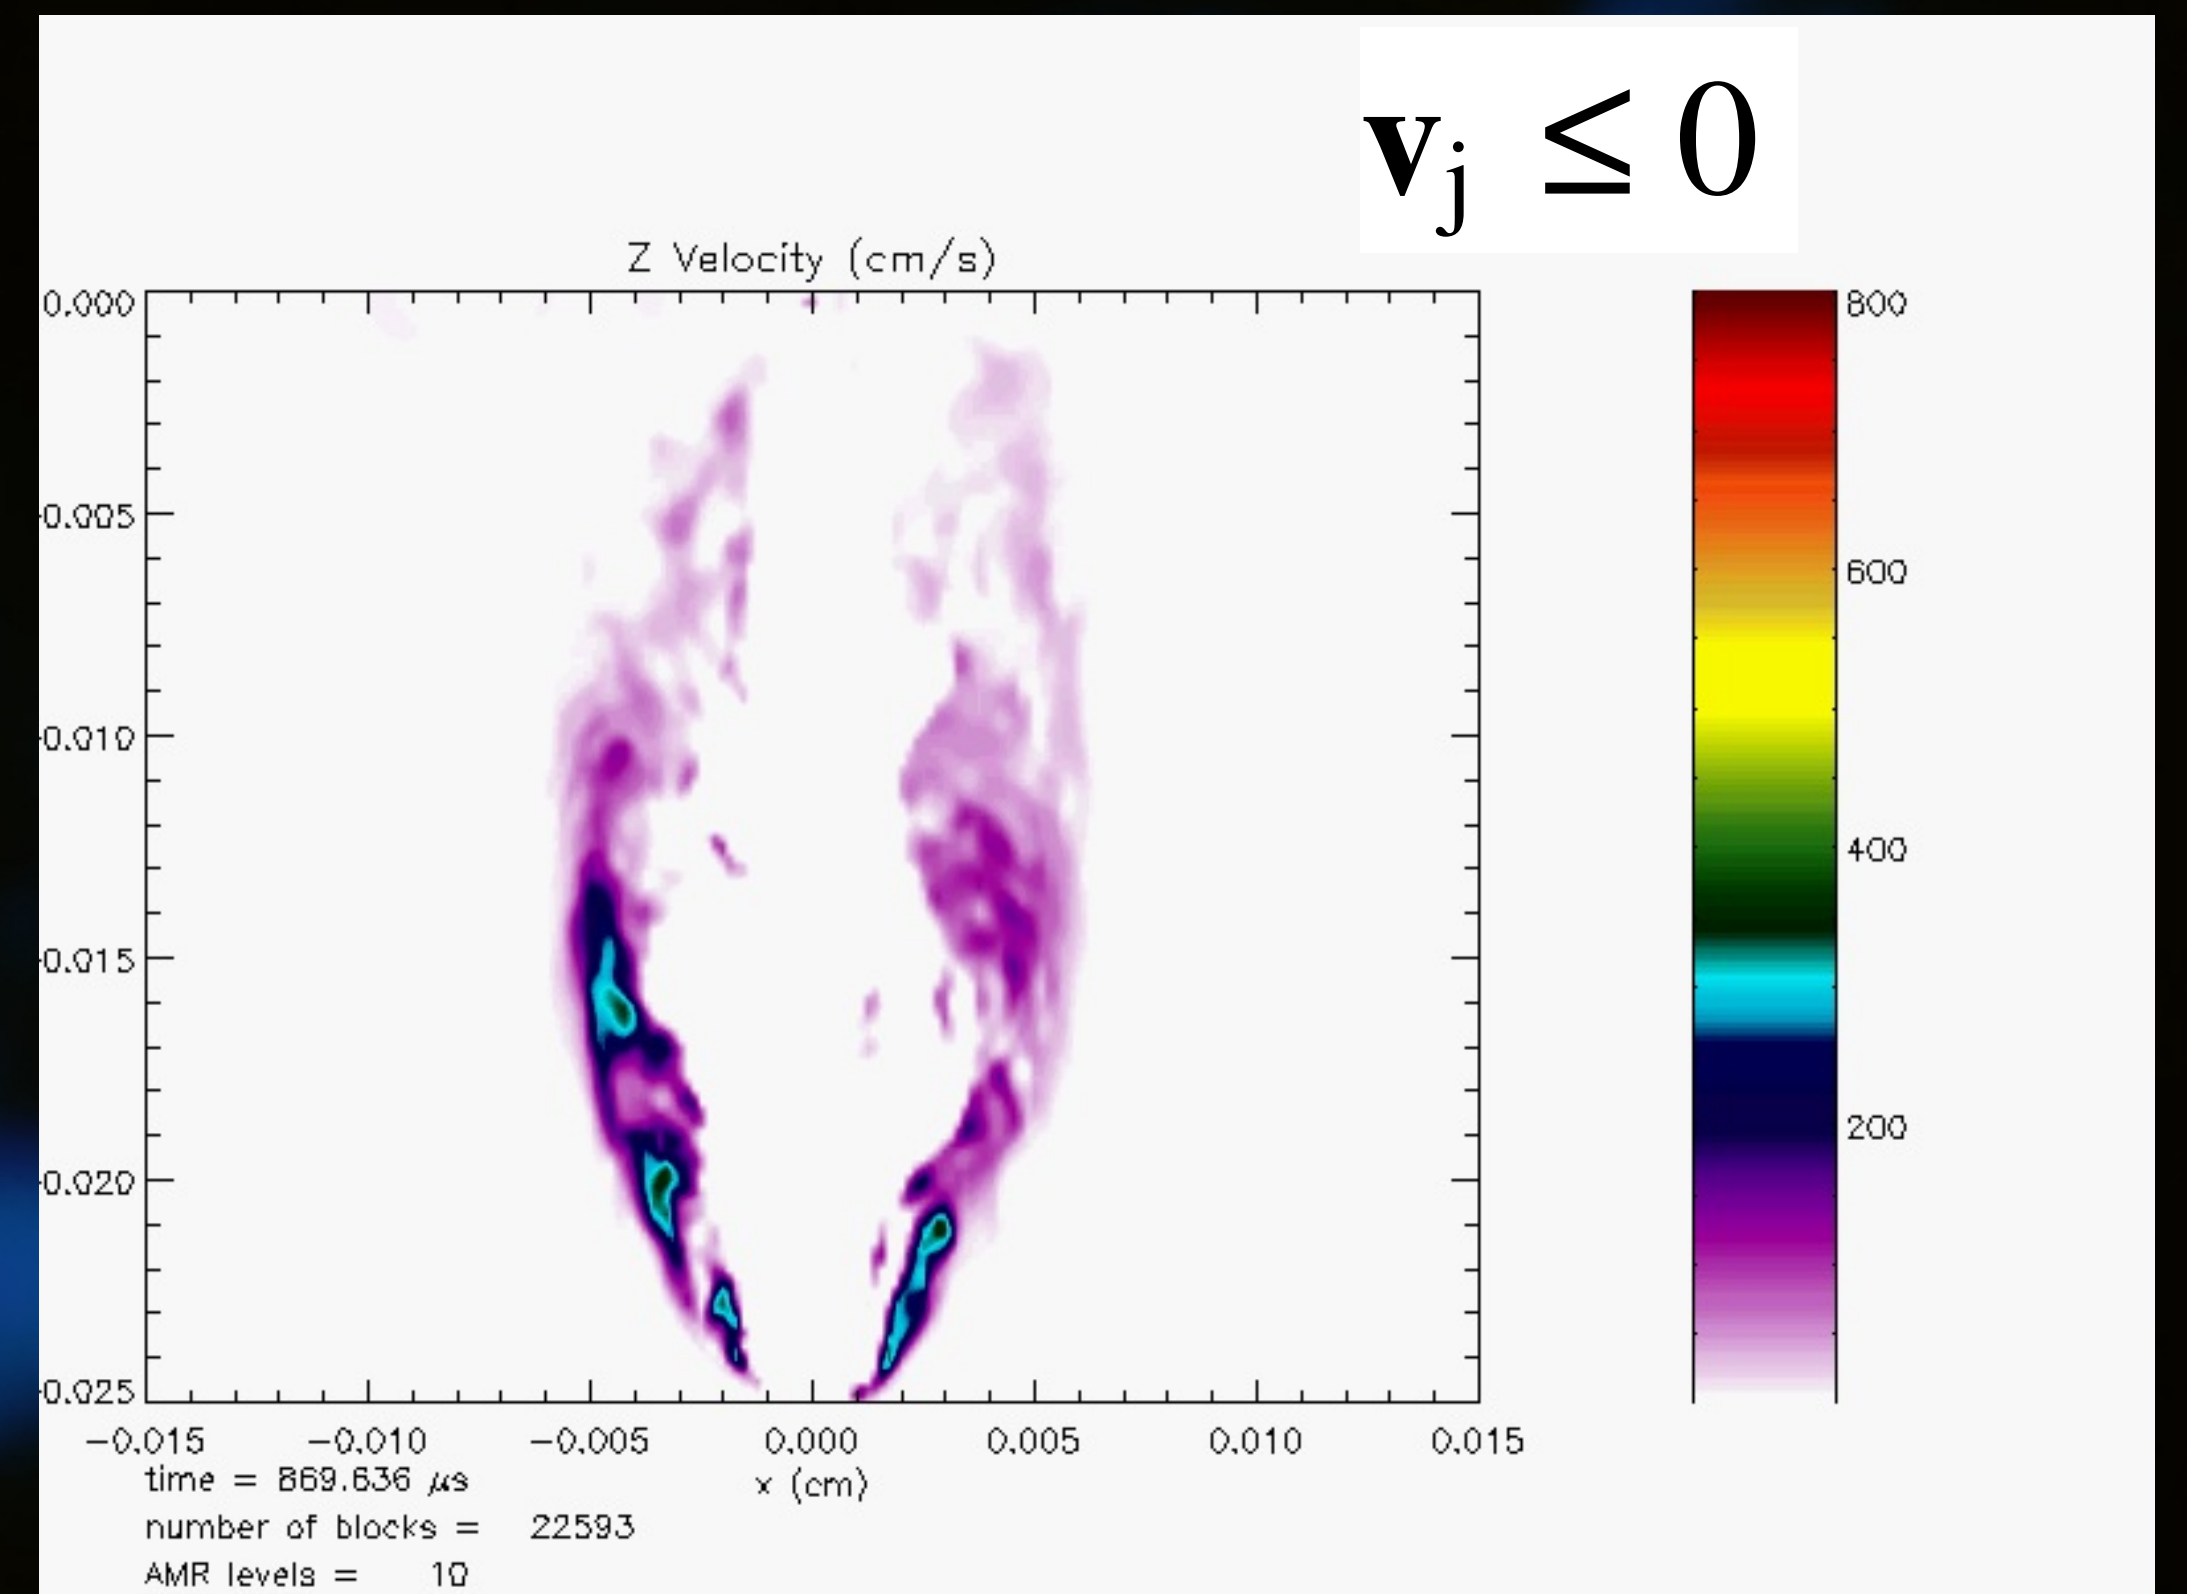

Numerical experiments

- Plotting only **counterstreaming** gas ($\mathbf{v}_z \cdot \mathbf{v}_j \leq 0$)

Numerical experiments

- Plotting only **counterstreaming** gas ($v_z \cdot v_j \leq 0$)
- Lessons:
 - 1) Backflow develops a *large-scale pattern* (HS \rightarrow meridional plane)

Numerical experiments

- Plotting only **counterstreaming** gas ($\mathbf{v}_z \cdot \mathbf{v}_j \leq 0$)
- Lessons:
 - 1) Backflow develops a *large-scale pattern* (HS \rightarrow meridional plane)
 - 2) Dynamics is *stochastic*

Numerical experiments

- Plotting only **counterstreaming** gas ($\mathbf{v}_z \cdot \mathbf{v}_j \leq 0$)
- Lessons:
 - 1) Backflow develops a *large-scale pattern* (HS \rightarrow meridional plane)
 - 2) Dynamics is *stochastic*
 - 3) No meridional plane bending of the flow is detected \rightarrow perpendicular backflow

Backflow

Backflow → enhanced mass accretion

Backflow \rightarrow enhanced mass accretion \rightarrow P_{jet} change with time

Backflow \rightarrow enhanced mass accretion \rightarrow P_{jet} change with time

Black curve: **template mass flow model**

On the right plot the predicted change in $P_{\text{jet}} \propto \Sigma^{3/2}(\rho v_z)^{1/2}$

Backflow → enhanced mass accretion → P_{jet} change with time

Black curve: **template mass flow model**

On the right plot the predicted change in $P_{\text{jet}} \propto \Sigma^{3/2}(\rho v_z)^{1/2}$

- P_{jet} enhanced by a factor ~ 10 on 15-20 Myrs.
- EUV ($\lambda \lesssim 1100 \text{ \AA}$) correlates with GHz synchr for RLQ

And now? So what??

Powerful Jet from a Supermassive Black Hole in Galaxy System 3C 321  HUBBLESITE.org

And now? So what??

- Star formation is classical physics → yet SMBH-galaxy co-evolution bridges with GWs and GR

Powerful Jet from a Supermassive Black Hole in Galaxy System 3C 321  HUBBLESITE.org

And now? So what??

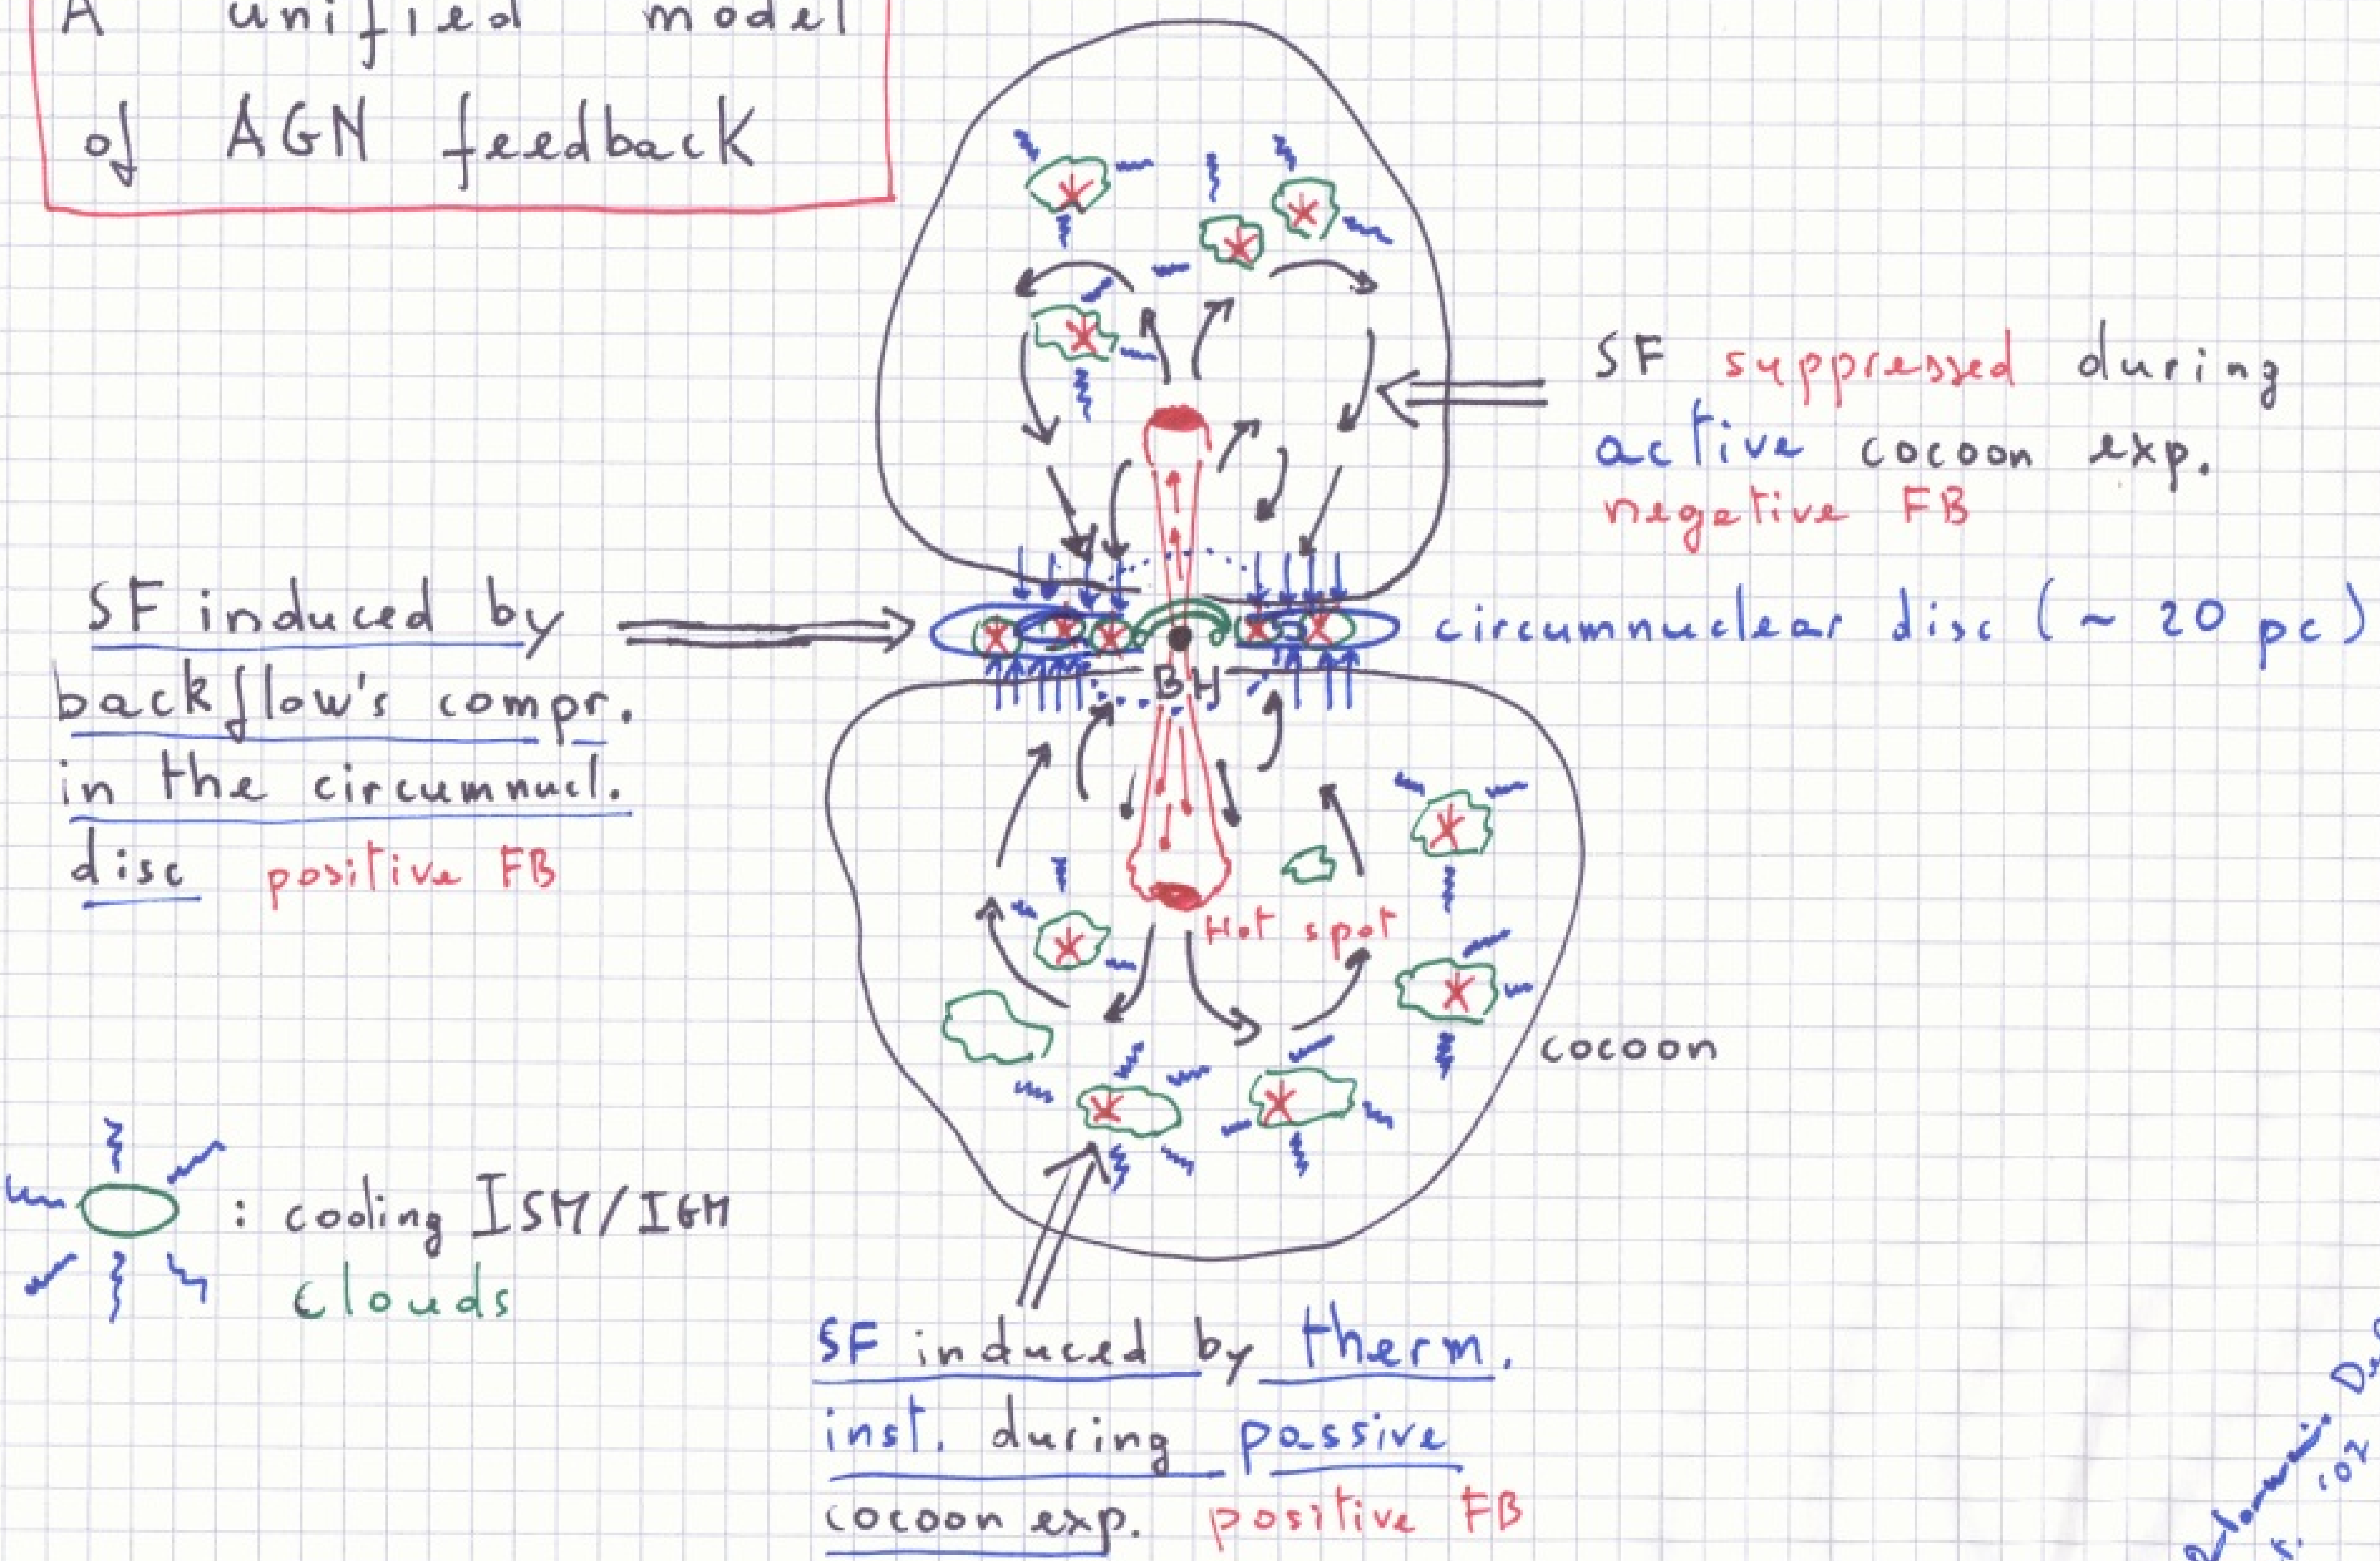

- Star formation is classical physics → yet SMBH-galaxy co-evolution bridges with GWs and GR
- The investment to fill the gap between subparsec (star formation) and kpc scales is also in new algorithms and HPC computing → Human Capital (young researchers) → buying silicon is not enough

And now? So what??

- Star formation is classical physics → yet SMBH-galaxy co-evolution bridges with GWs and GR
- The investment to fill the gap between subparsec (star formation) and kpc scales is also in new algorithms and HPC computing → Human Capital (young researchers) → buying silicon is not enough
- Tighter interaction with the Numerical Analysis and Computational Physics communities → credible physical targets and language

My "unified" mechanical AGN feedback model

A "unified" model of AGN feedback

Black Holes-galaxies co-evolution

Physical Models

- Jet's feedback - Jet's production, SMBH accretion: highly decoupled in spatial scales, but strongly coupled energetically (GRMHD - Tchekhovskoy, Sądowski, McKinney..., theory: Paczinsky, Abramowicz, Narayan, Lasota)
- Positive feedback: outflows at $z \gtrsim 1$ (Maiolino, Lehnert) - is it cosmologically significant? Can it boost significantly the SFR?
- SMBH physics: directly accessible through GWs \rightarrow BHs' growth history and SF history
- Backflow: low L_z accreting gas from large (SF) to AU (BH) accretion scales, connection between
