

**Local Scaling Relations of  
Super-Massive Black Holes:  
*Origin, Evolution, Consequences***

**FRANCESCO SHANKAR**

With: D. H. Weinberg, J. Miralda-Escudé, M. Bernardi,  
L. Ferrarese, J. Moreno, R. K. Sheth, Y. Shen, R. Läsker

# WHAT I WILL DISCUSS:

*Local Scaling Relations:*

**Slopes, Breaks, Scatters, BHMF**

*Semi-empirical Models:*

**Accretion, Clustering, z-Evol.**

*More Advanced Models:*

**Mergers vs secular models**

See talk by Michaela Hirschmann for further insights into models!!

Reviews available: Shankar 09; Shankar 13

*Local Scaling Relations:*

**Slopes, Breaks, Scatters,  
BHMF**

# The «Magorrian» relation: $M_{\text{BH}}-M_{\text{bulge}}$

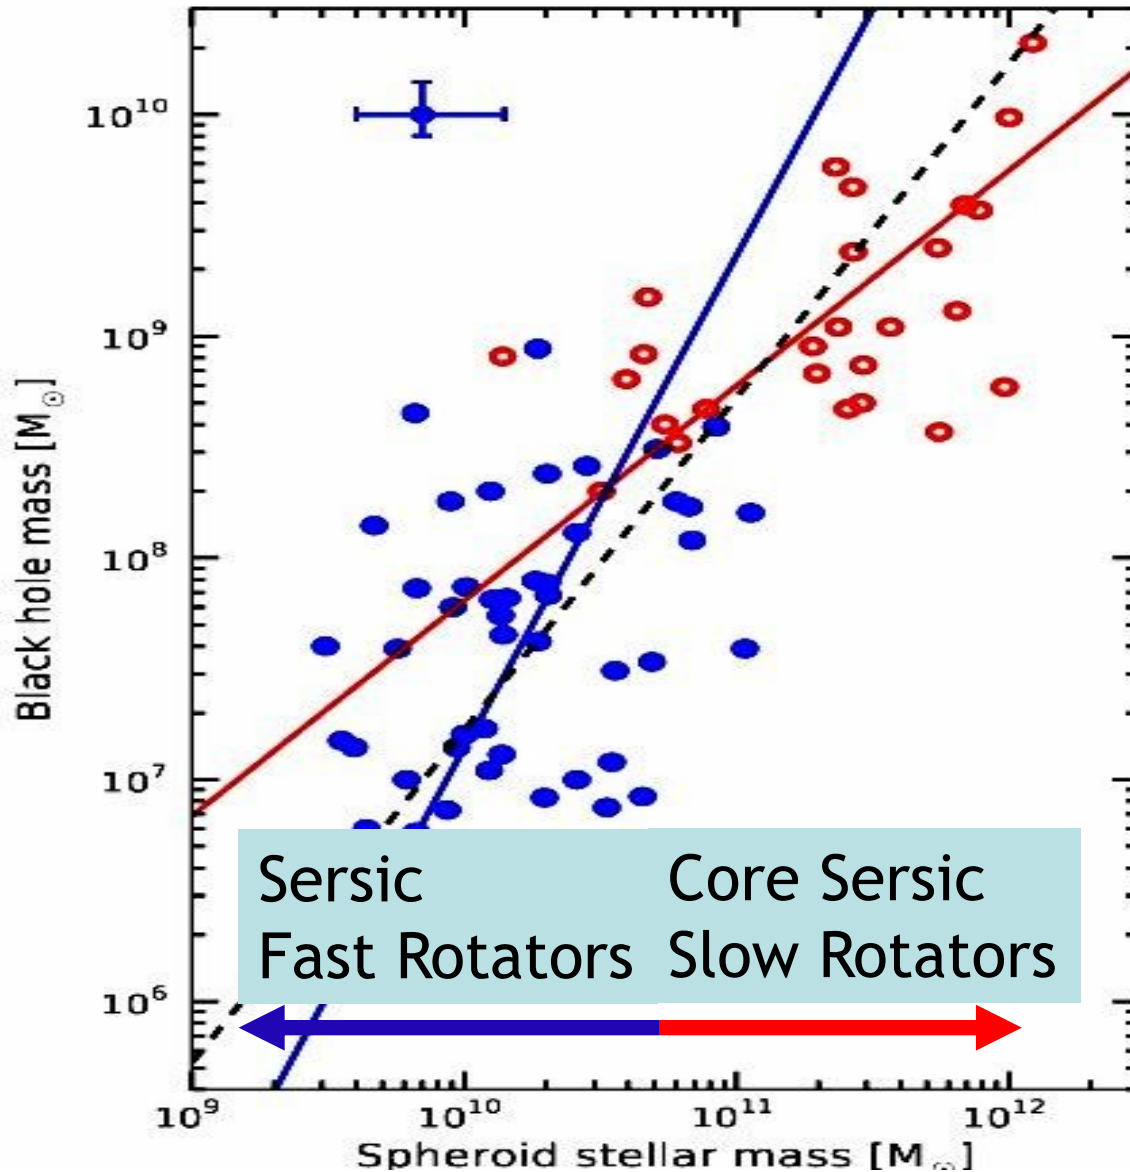

Marconi-Hunt 03  
Haering-Rix 04:  
Slope about unity,  
normalization  
about  $10^{-3}$

Sample of about 30  
Galx, bulge masses  
from NIR (MH)  
or dynamical (HR)  
*scatter < 0.3 dex!!*

See also Sani+11,  
Beifiori+12, and  
many, many others

# The «Magorrian» relation today ?

Scott et al. 2013  
Graham 2012  
sample of 75 galx;  
bulge masses from  
K-band corr.;

*slope* from 2.2 to 1,  
*scatter* from 0.9  
to 0.47!!

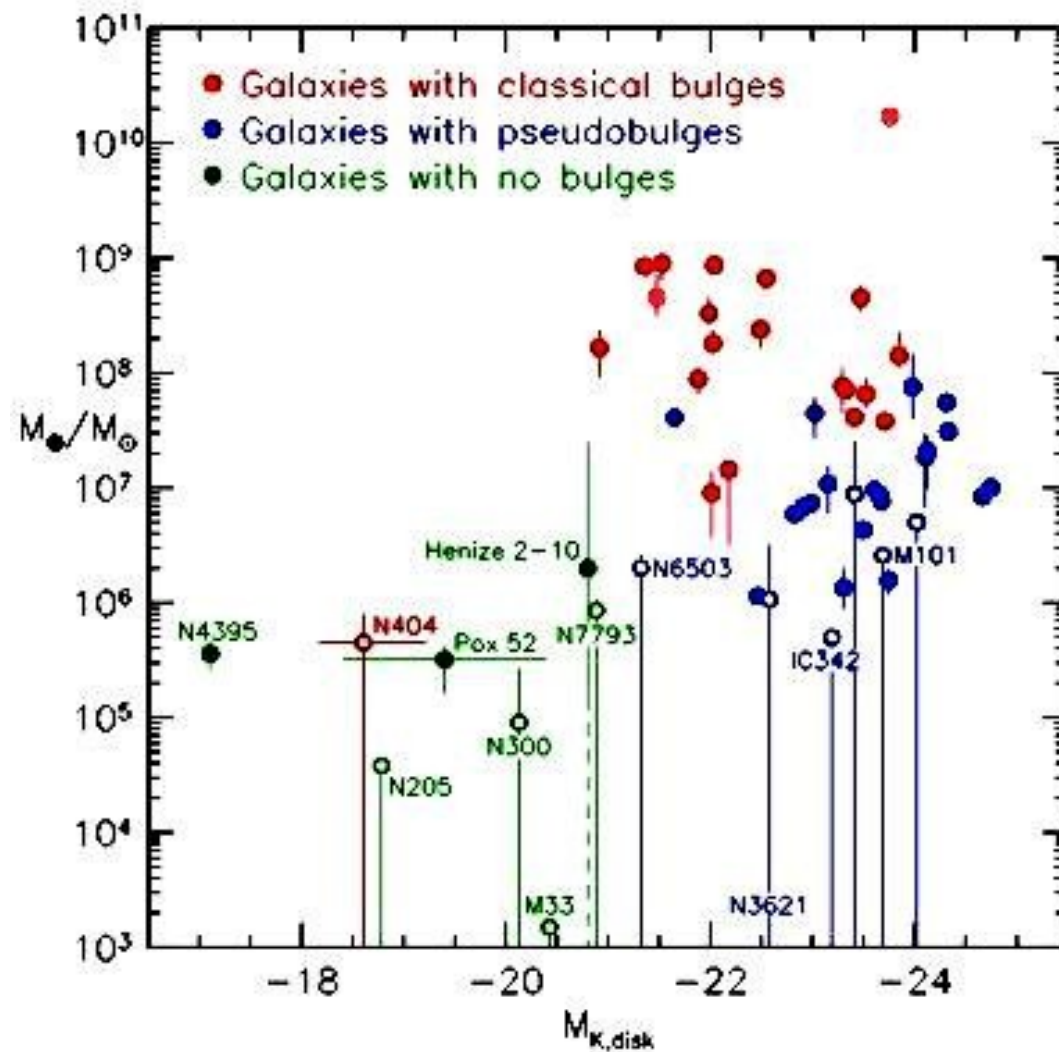

# Is this real? On more general grounds:

BUT see Läscher et al. 2014!!

Kormendy & Ho 13

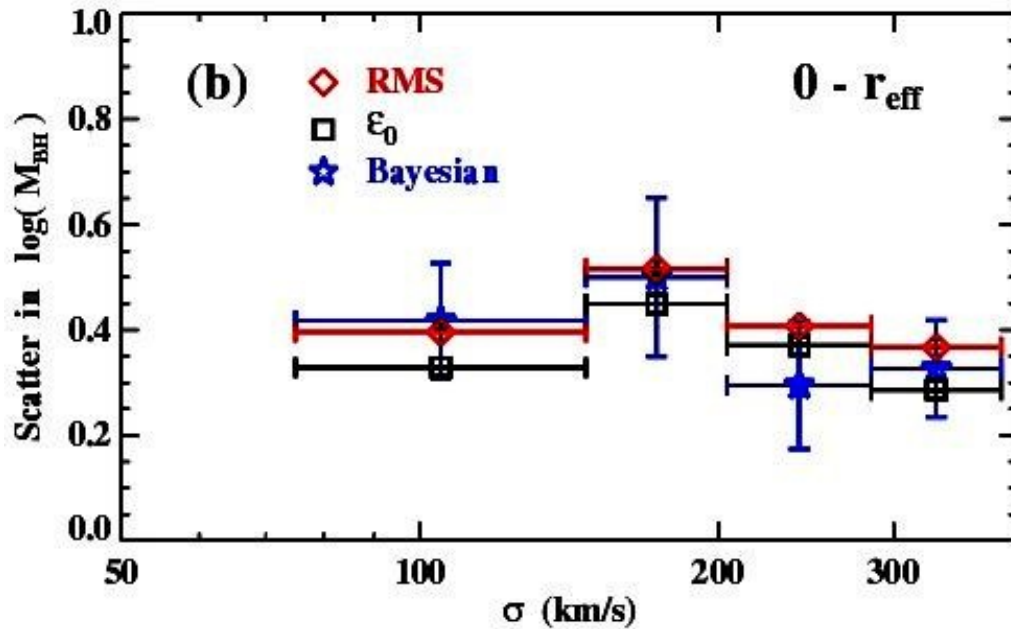

# Is there a correlation with disc?

BUT see Läscher et al. 2014!!

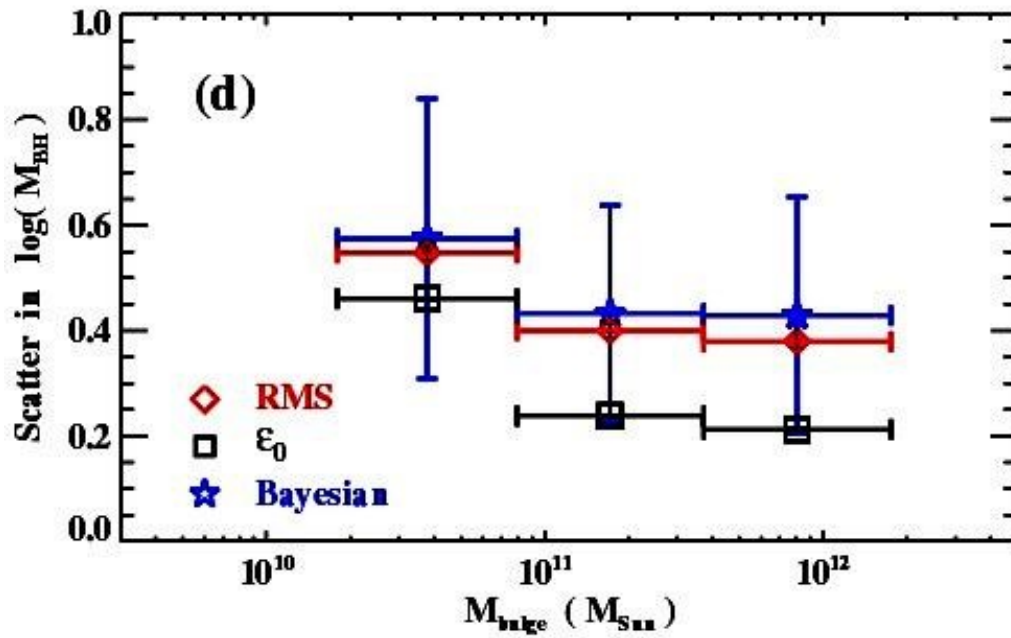

Kormendy & Ho 13

# The M<sub>bh</sub>-sigma: The most fundamental?

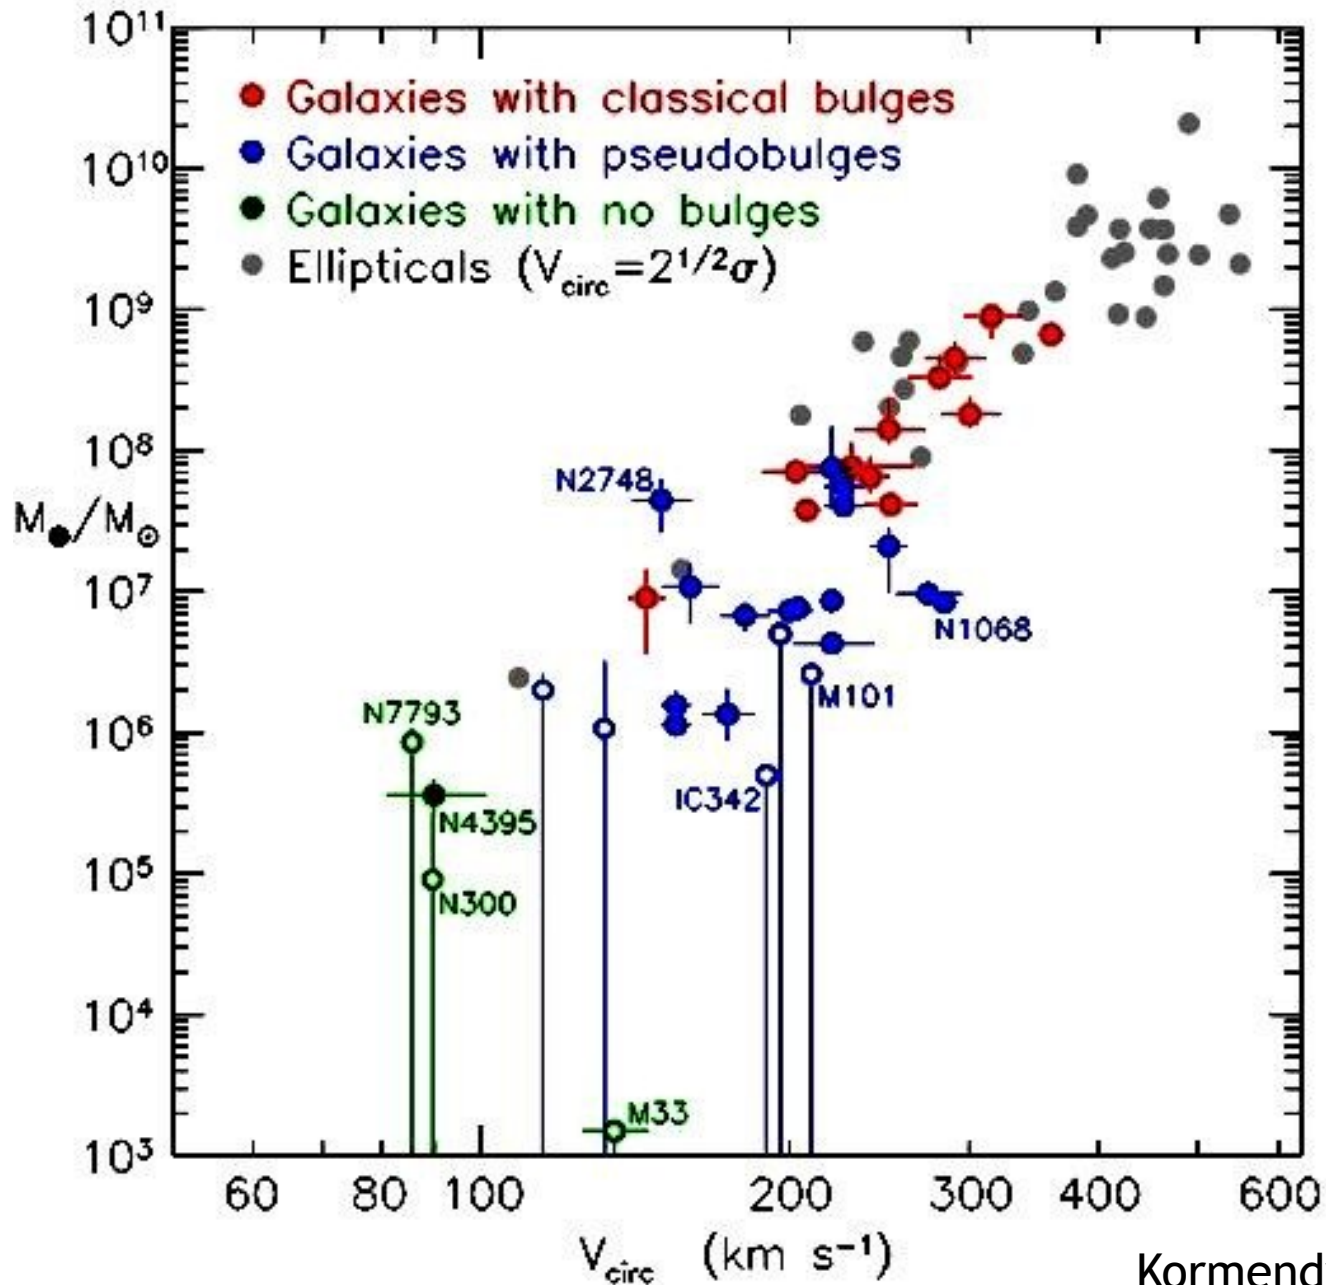

Scatter always  
Ranging within  
0.3-0.5 dex

First study differential:  
possible evidence  
for decrease at  
high masses,  
still unsecure and only  
in M<sub>bulge</sub>!

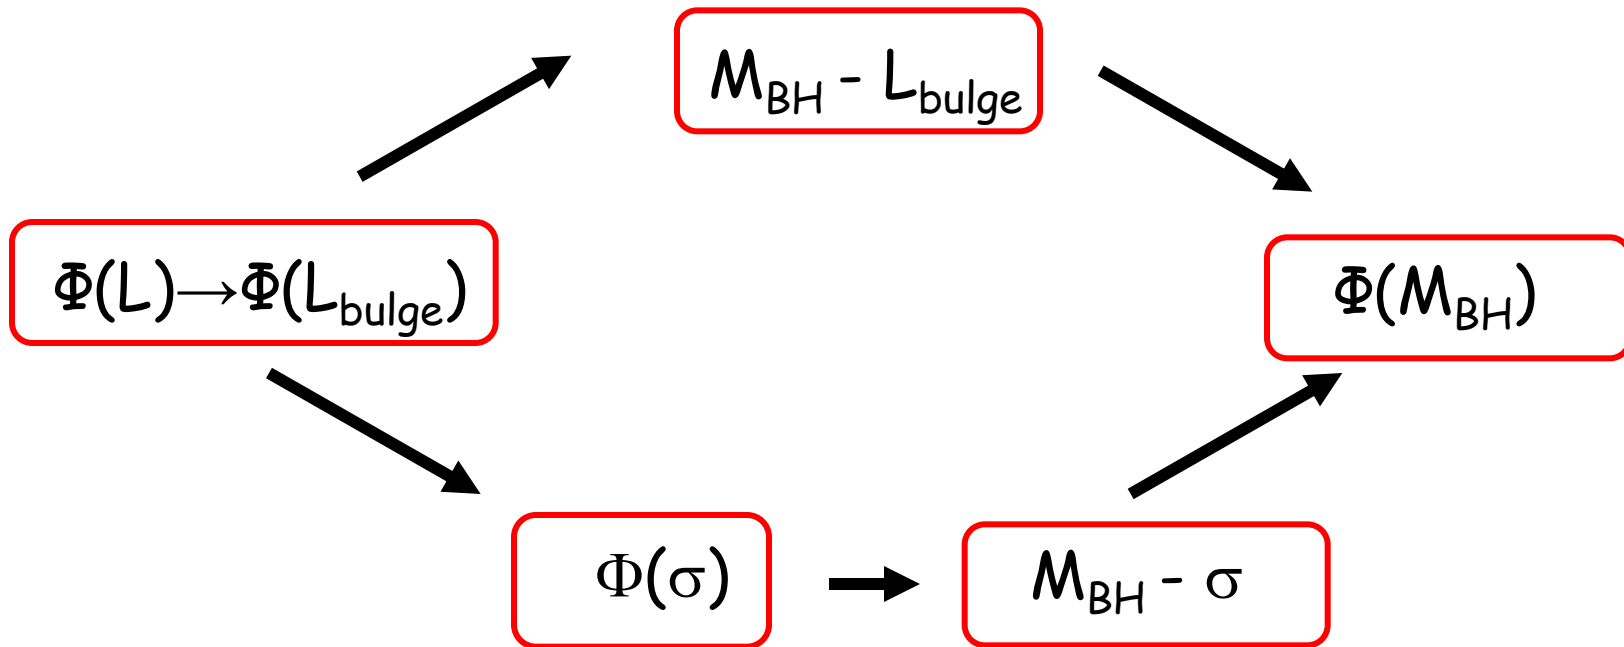

# Is there a correlation with DM halo?

# How many SMBH? How Massive?

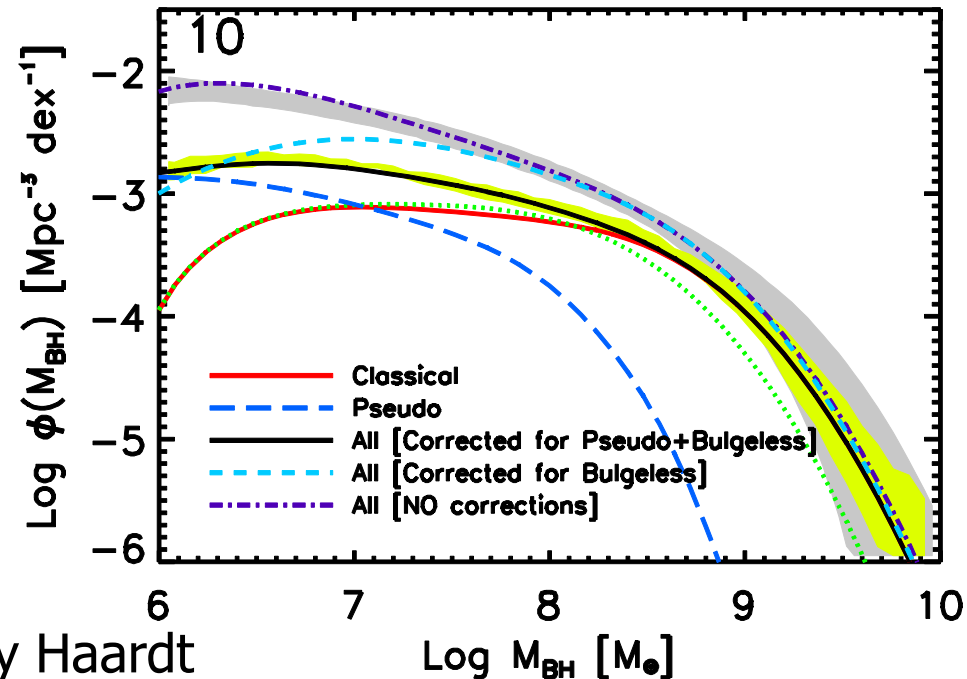

Several caveats: scatter, relations, variables, color change, bulge fractions, methodology, etc...

Different methodology  
different results at  
(low!) masses

Different «populations»:  
Pseudo bulges, nuclear  
Star clusters, ....  
Though mainly affecting  
(again!) low masses

See talks by Hirschmann, (seed BHs) by Haardt

*Semi-Empirical Models:*

**Accretion, Clustering,  
Redshift Evolution**

# The Continuity Equation

$$\frac{\partial n(M_{BH}, t)}{\partial t} = - \frac{\partial}{\partial M_{BH}} \left[ \left\langle \frac{dM}{dt}(M_{BH}, t) \right\rangle n(M_{BH}, t) \right] - \frac{dS}{dt}_{in} + \frac{dS}{dt}_{out}$$

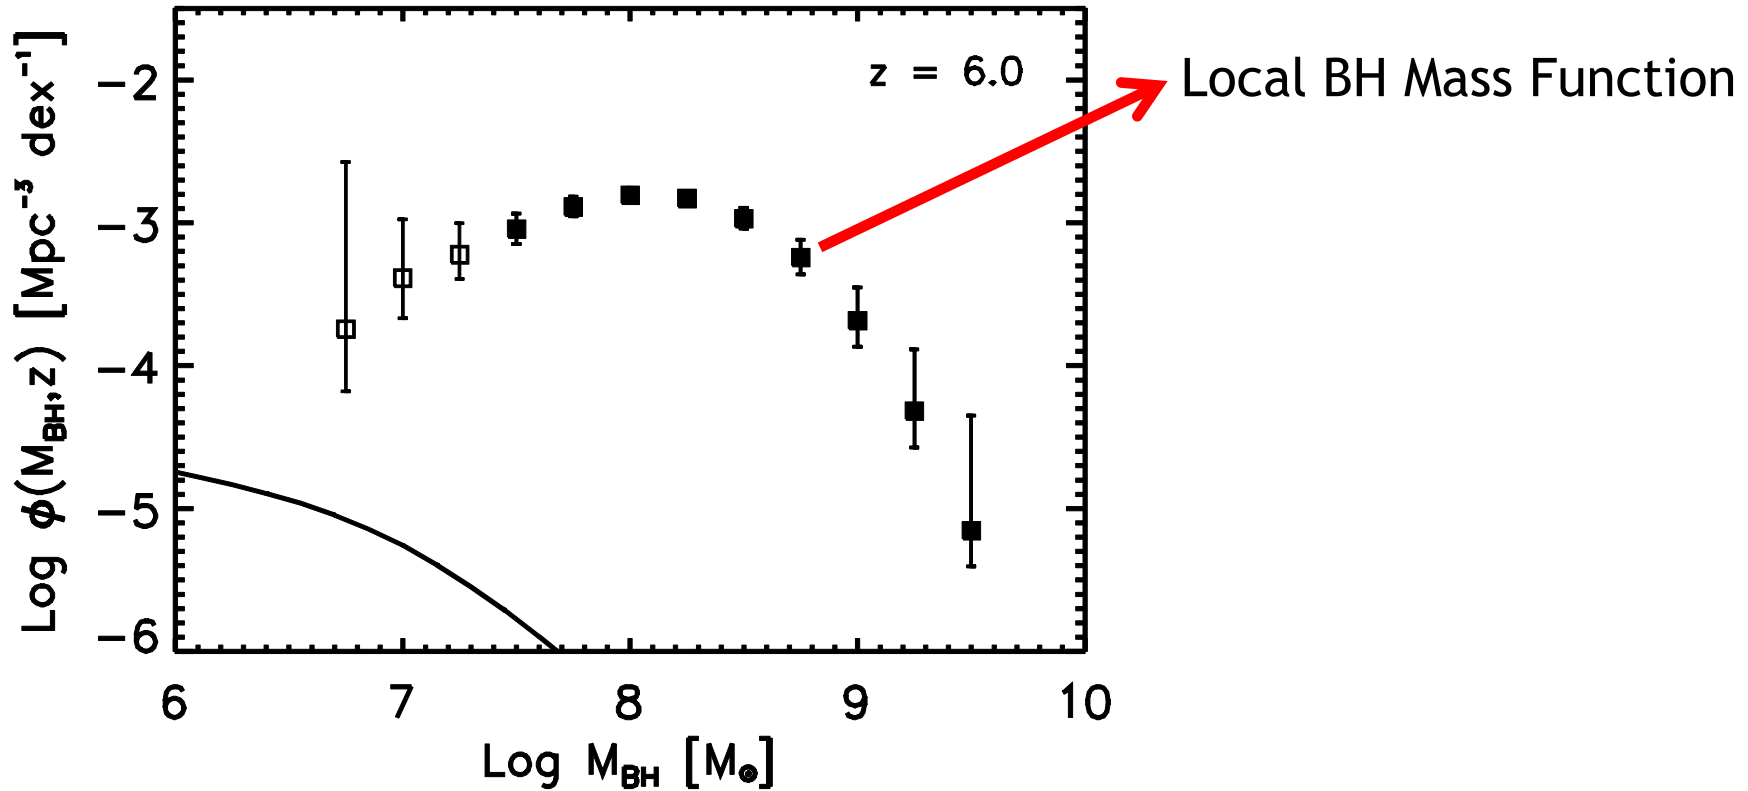

**Accretion Term:** proportional to  $P(\lambda, M_{BH}, t)$ /radiative efficiency;  
The sum of all active BHs must give you the observed AGN LF!

**Merger Term:** at the rate implied by hierarchical mergers of DM haloes

See Raimundo's Talk!

**Main references** : Cavaliere et al. (1971);  
Soltan (1982); Small & Blandford (1992); Salucci et al. (1999)

# Empirically predicting BH Mass Function

## CONTINUITY EQUATION MODELS OF THE BH POPULATION

$$\frac{\partial n(M_{BH}, t)}{\partial t} = -\frac{\partial}{\partial M_{BH}} \left[ \langle \dot{M}(M_{BH}, t) \rangle n(M_{BH}, t) \right] + \dot{S}_{in}(M_{BH}, t) - \dot{S}_{out}(M_{BH}, t)$$

# Same evolution as in SFR, with Magorrian ratio!

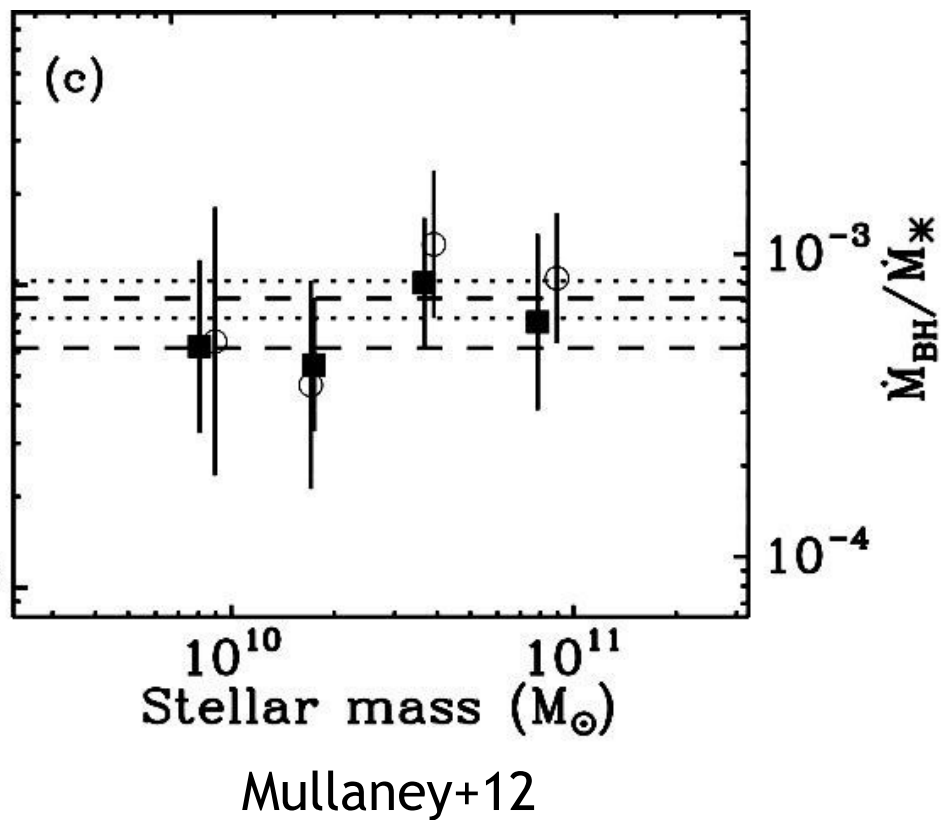

Marconi+04;Merloni+04;Hopkins+07;Silverman+08;Zhang+09;FS+09

# A step further: correlating SSFR to Specific BH growth!

FS+13

$L_X/L_{\text{IR}}$  0.01

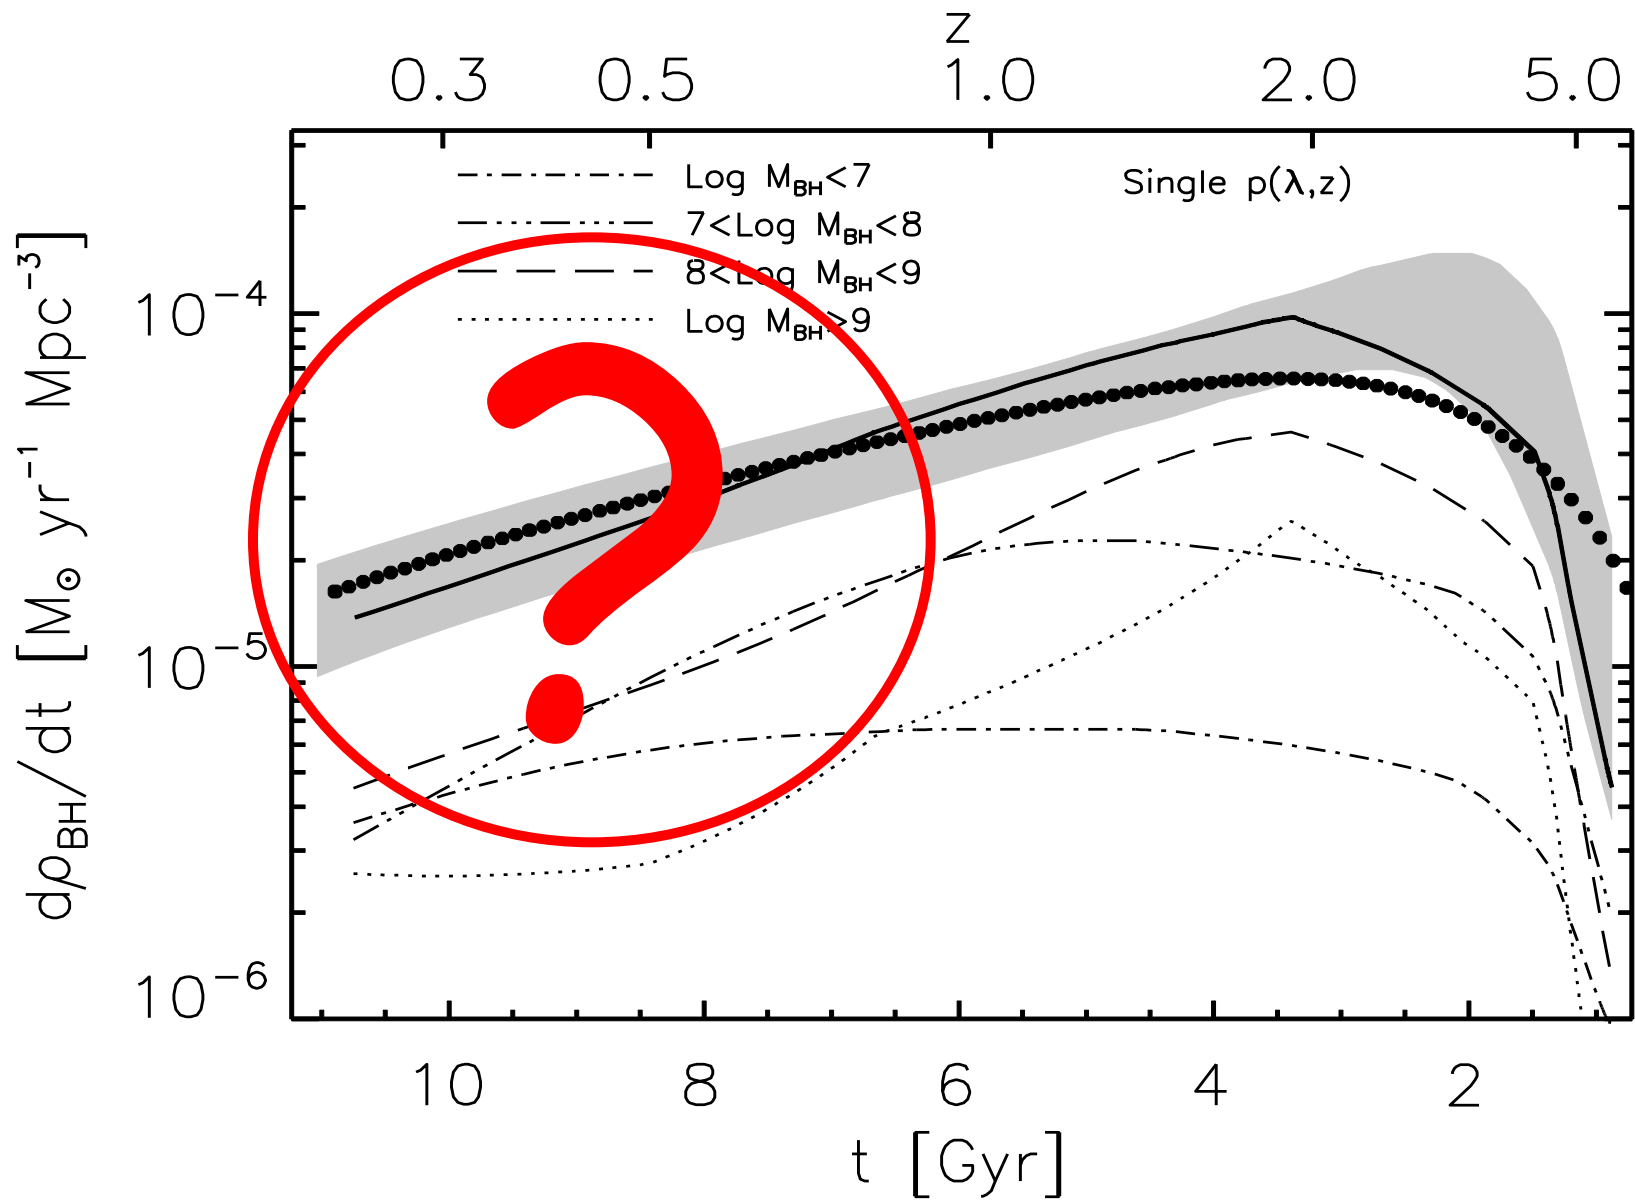

See Rodighiero's Talk!

Most of the SFR in **Discs** at  $z < 1$  or so...

# Same evolution as in SFR, with Magorrian ratio!

Marconi+04;Merloni+04;Hopkins+07;Silverman+08;Zhang+09;FS+09

# Is there a correlation with disc?

# Is the emergence of bars responsible for triggering AGN at low $z$ ?

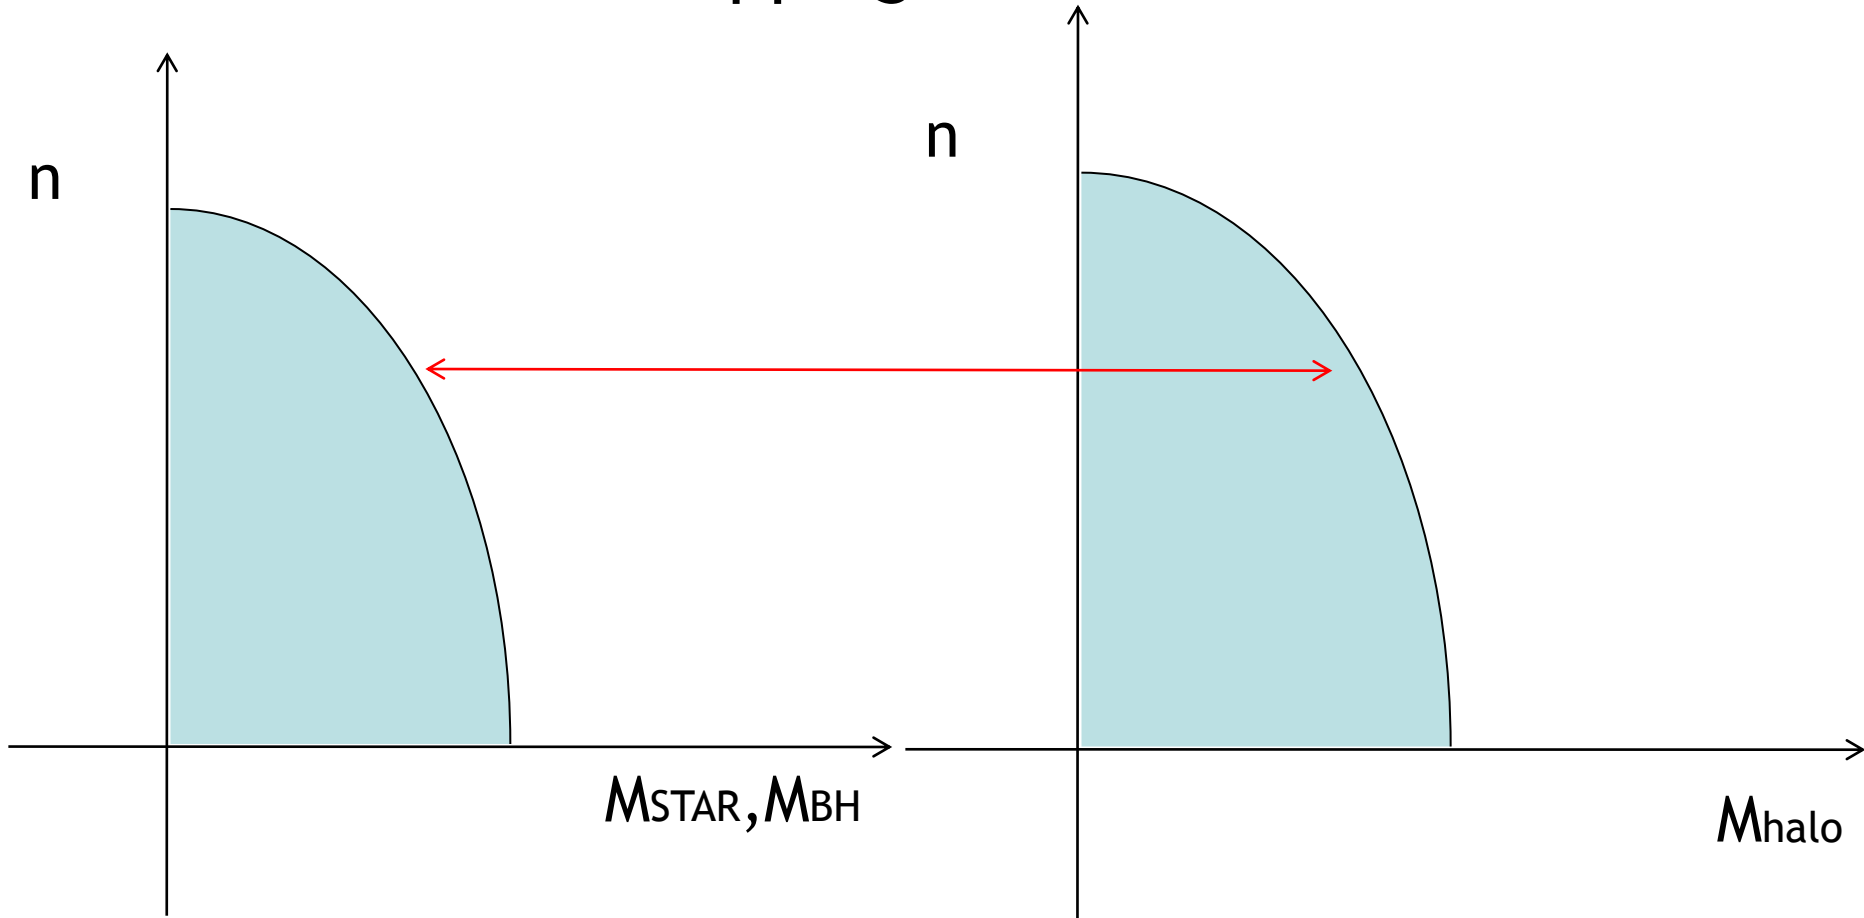

Cheung+14; see also Cisternas+14

# *Semi-Empirical Models:* **Accretion, Clustering, Redshift Evolution**

Haiman&Hui01; Martini&Weinberg; Gilli+07; White+08;  
Shen 09; Wyithe & Loeb 10; Bonoli, FS+10; FS+10

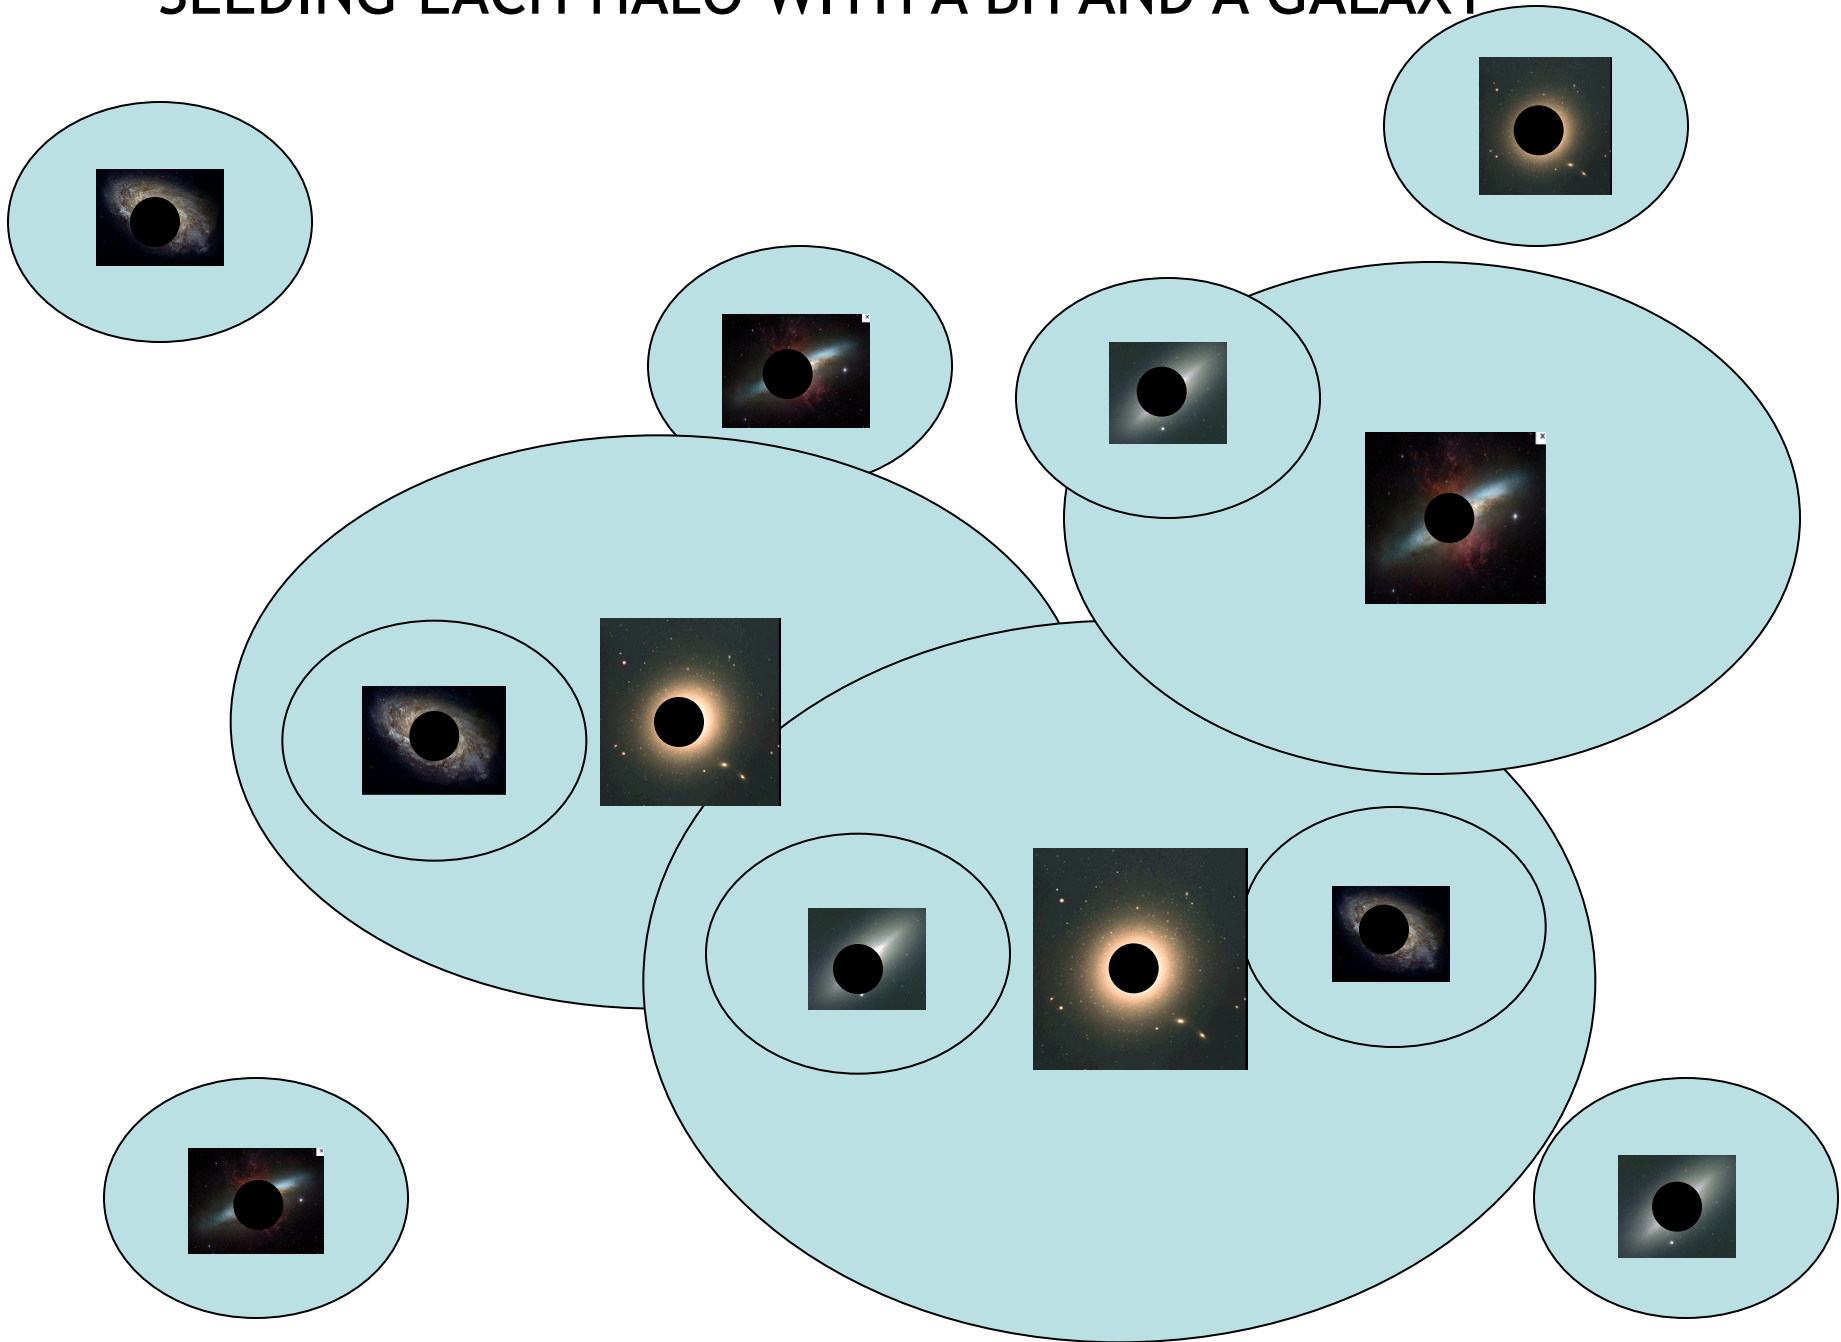

See, e.g., talks by Alleinato, Cappelluti, etc...

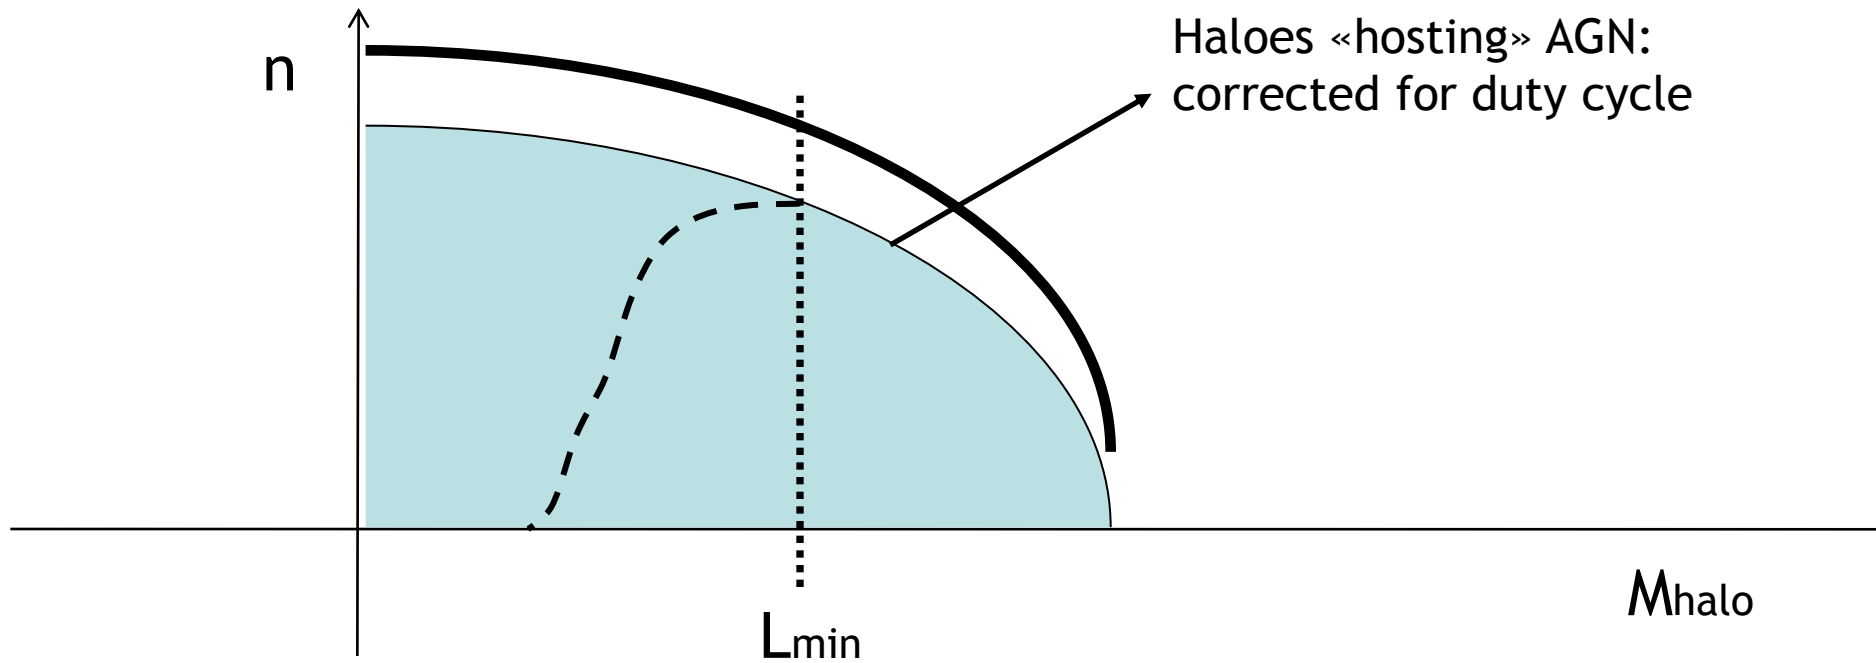

# From BHMF to mapping with Dark Matter Haloes!

Rank Ordering: --> median relation  $M_{star, MBH}$ -Halo mass

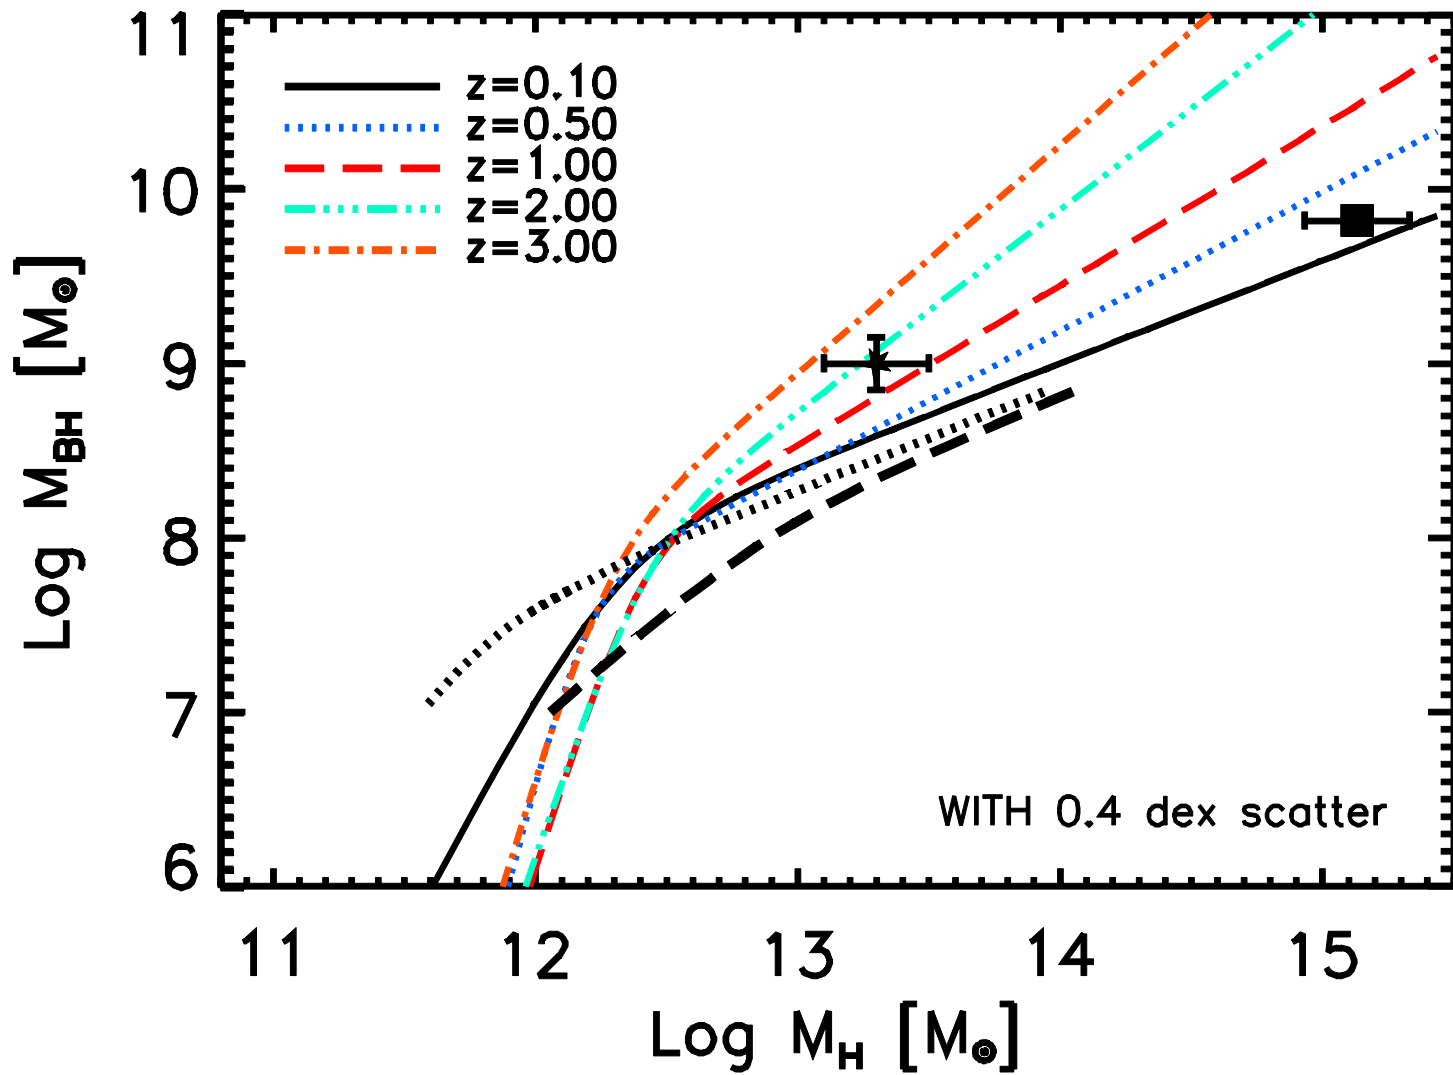

# SEEDING EACH HALO WITH A BH AND A GALAXY

If there is substantial scatter, many low mass haloes will enter the selection and lower the inferred clustering (bias)

# Is there a correlation with DM halo?

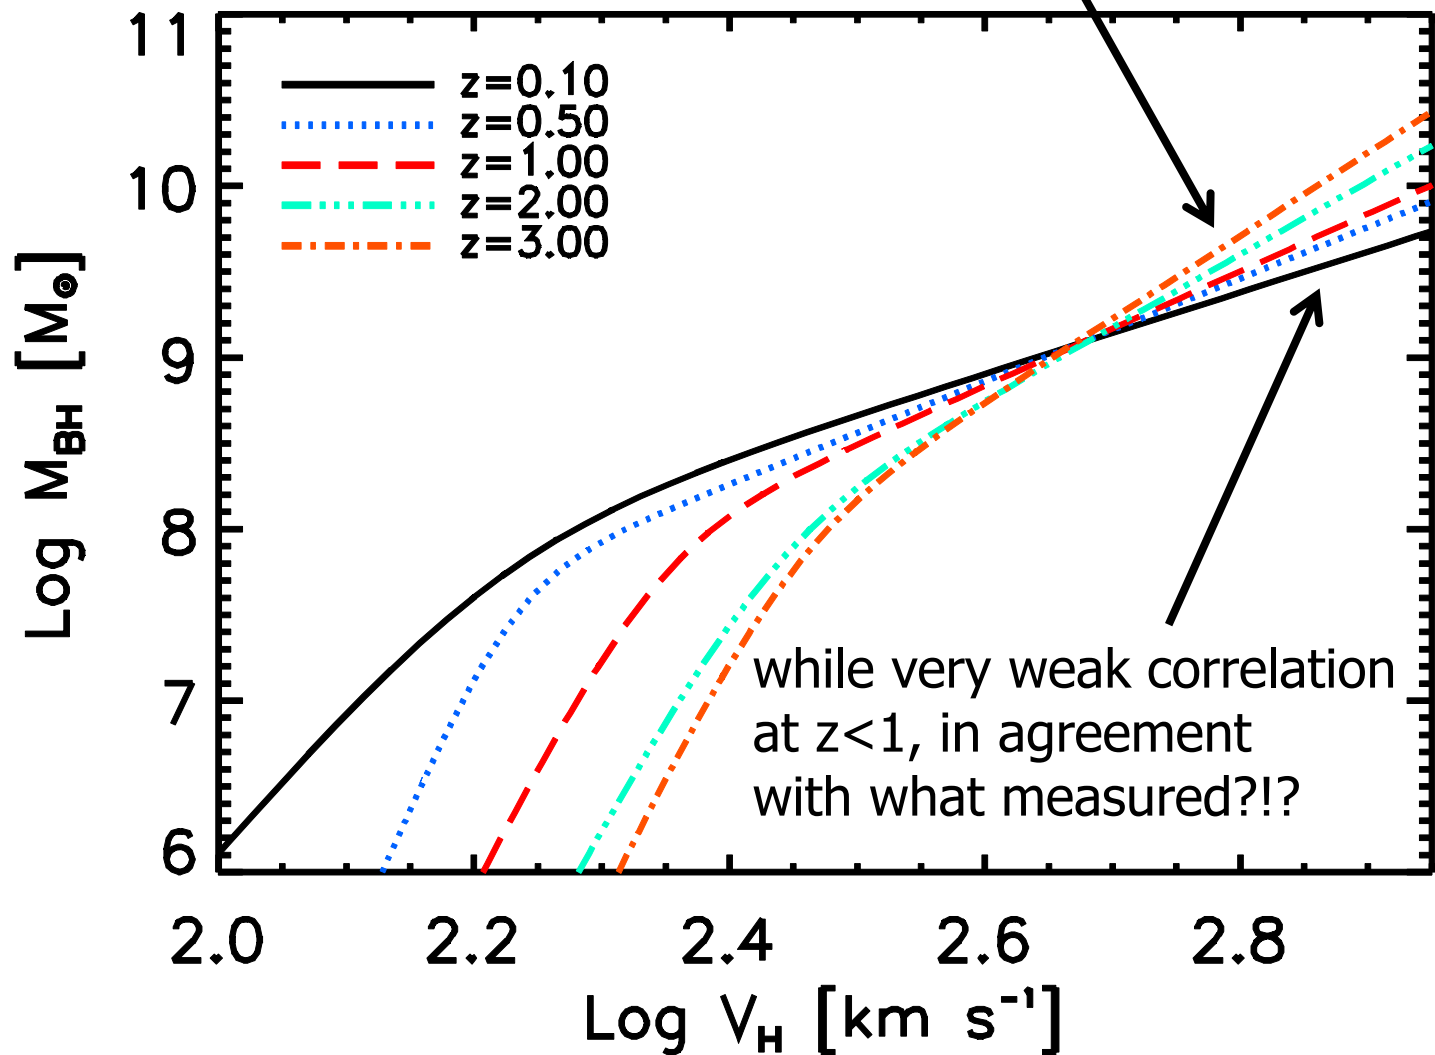

Just the opposite at  $z > 3$ : very large scatter and duty cycles require **limited scatter**  $< 0.3$  dex for luminous QSOs

White+08; see also Shen 09; Wyithe & Loeb 10;  
Bonoli, FS+10; FS+10

At  $z > 1$  steep slope close to  $\sim V^5$   
as expected from AGN  
feedback models!

A **BASIC ABUNDANCE MATCHING** MODEL IS BROADLY CONSISTENT WITH AT LEAST THE LARGE SCALE CLUSTERING OF QUASARS

CONROY & WHITE 13

see also Gilli+; Hickox+; Magliocchetti+ and many others...

SMALL AND LARGE SCALES INFORMS US ON THE RELATIVE PROBABILITIES FOR **SATELLITES** AND **CENTRALS** TO BE ACTIVE

*Semi-Empirical Models:*

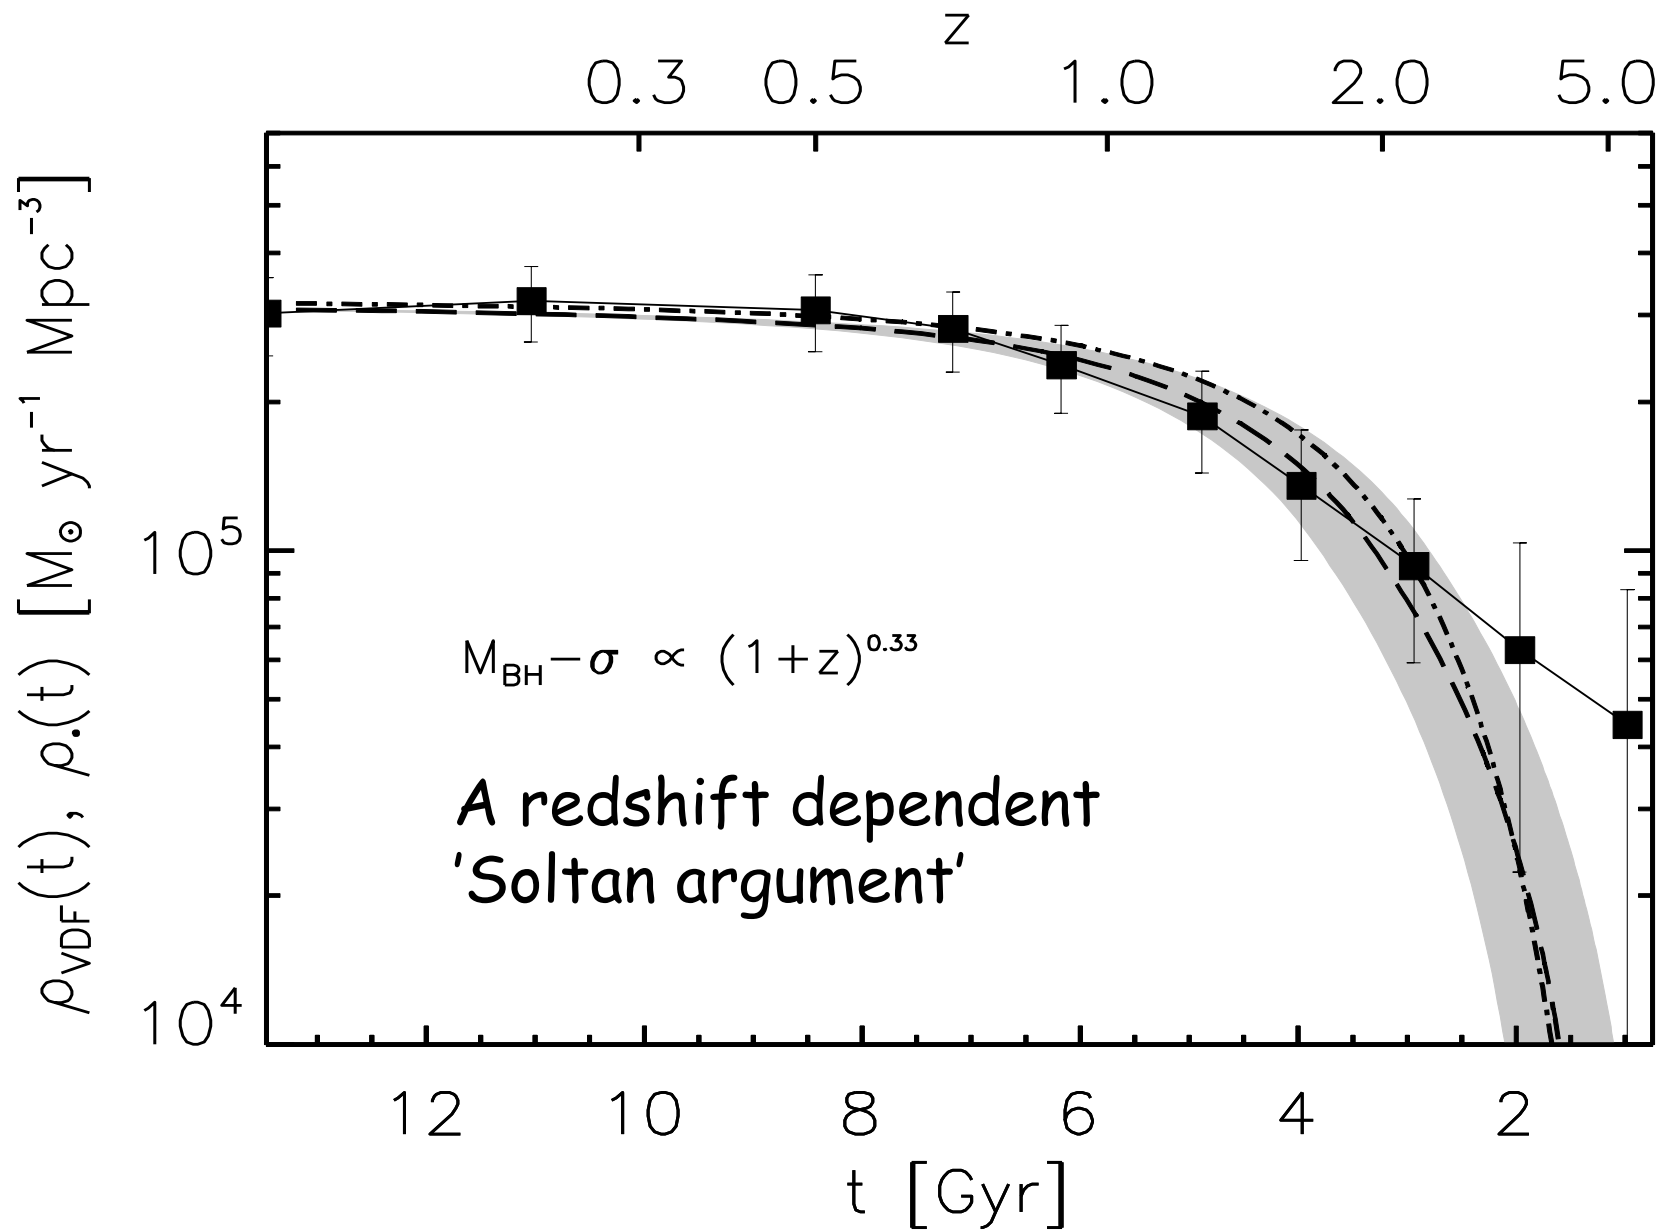

**Accretion, Clustering,**

**Redshift Evolution**

See talks by, e.g., Vignali, Valiante, ...

In the Mbh-sigma nearly absent!

Confirmed by Yu & Lu!

Interestingly, when they repeat  
**for stars** they find significant positive  
Evolution, **consistent with Merloni, Decarli....**

Zhang, Lu, Yu 2012

And by direct measurements! Reliable?!?

Salviander & Shields 2013

*More Advanced Models:*  
**Mergers vs**  
**secular accretion**

(IMPACT ON SCALING RELATIONS)

In this models ONLY mergers trigger BH growth!

Large scatter at low masses mainly because of **inefficiency of mergers**, closer to «seed" BH masses!

At the other extreme:  
Even with NO  
Accretion,  
ONLY mergers at  
the rate predicted  
by LCDM can  
already predict  
a linear relation!

Jahnke+Maccio 11

# EFFECTS OF BH GROWTH IN SECULAR EVOLUTION?

Interaction-Driven

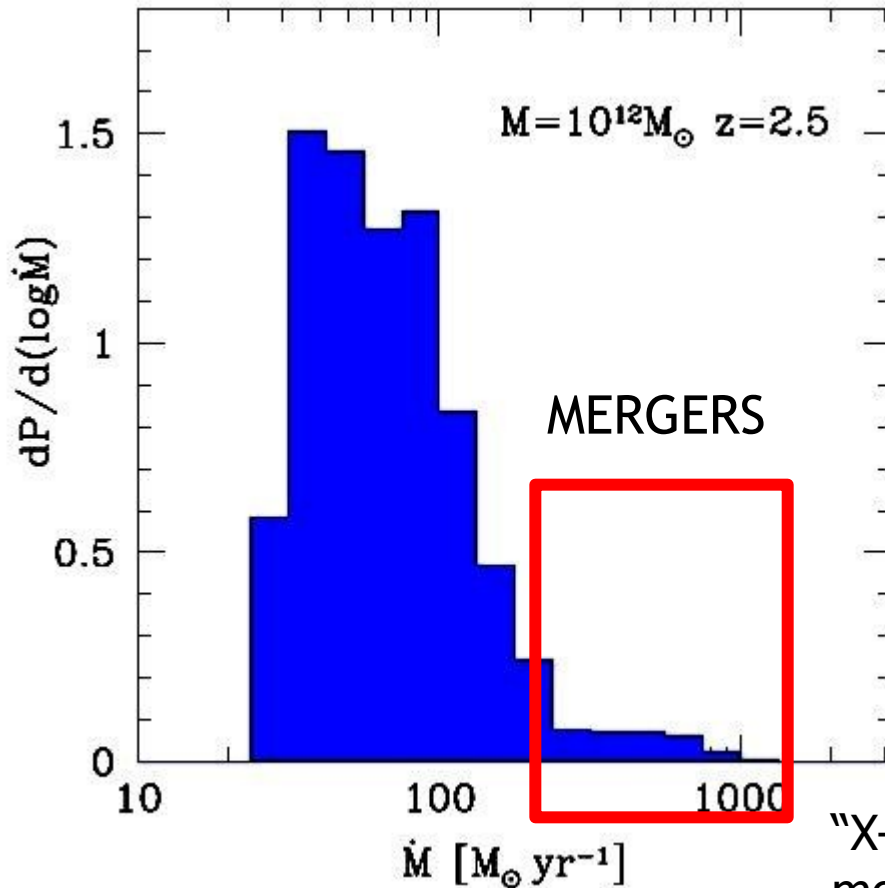

Disk Instabilities

Menci+14

# SOME RECENT PROPOSALS FOR IN-SITU BH GROWTH: COLD FLOWS

Dekel+09

Bournaud, ...FS+11

"X-ray data show that ... AGN fueling modes at  $z \sim 1.85$ ---whether violent disk instabilities or secular processes---are as efficient in smooth galaxies as they are in clumpy galaxies." Trump+14

# WHAT I DISCUSSED:

*Local Scaling Relations:*

**Possible breaks, high scatter**

*Accretion and Clustering:*

**Evol. w/ SFR, evolving scatter**

*Evolution with redshift:*

**Yes M<sub>bh</sub>/M<sub>star</sub>, NO M<sub>bh</sub>/sigma**

*Galaxy co-evolution:*

**Triggering by mergers favoured**
